>That s neary apple talk ;-)

Mor like common SLIP.
Besides, Appletalk is just the protocol, whereas Localtalk is the hardware
layer. How about porting netatalk to the ST? Perhaps has this already been
done for MiNT?

Well, for serial ports, that is rather high-speed. One problem on the Mac is
that this high performance is only possible through the single-tasking OS.
Linux and *BSD ports don't support Localtalk due to its unreliability in a
multitasking, protected environment.

>On the Mac this port was used to connect to a bus via tranceivers, I
>haven't seen similar solutions for the Falcon and TT.

Oh, so those boxes are transceivers? I thought they were just a bundle of
wiring.

Why do you assume that the attacker is an Amiga user?
Besides, Atari were not not not the company which originally worked on the
Amiga. That was Amiga corp. Atari simply supported them financially for a
while before Commodore bought it.
And Tramiel never sold CBM, he was kicked out of the company.

I don't think they had bad software at all. Besides, the C64's technological superiority visavis the XL series is subject to discussion. The C64 had the absolutely best sound chip produced until the Amiga's Paula, surpassing the ST's Yamaha chip, too.
The C64 Basic was horrible (Being a Microsoft product, after all), but the Amiga Workbench was even from the start a very competent system, albeit perhaps overtly complex for the hardware and memory space it had to run in.

Yes there is. I use 'Safe Menu' in the autofolder. Works also in TT
b/w mode. This is the description in Dutch:

Safe Menu: voorkomt dat te pas en te onpas de menu's bovenaan het
scherm per ongeluk omlaag klappen. Men kan zo meer Mac-alike
werken; menu's klappen pas neer na een muisklik. Werkt ook op de
TT z/w.

Just looking at both says it all. I have and use the Link II with my STe setup. It is a more compact device and does not need a power supply or anything like that. I believe it also supports parity and can handle upto seven devices. It is only about 2 inches wide and 1.5 inches long. Mine came with the cable that goes from the Link II to the ST, but a friend built the SCSI cable for me. It is a wise investment and only cost me about $100.

3749. Correct settings of STinG 1.26?

Newsgroup: comp.sys.atari.st
Date: 2000-10-08 00:00:00 UTC
From: Henrik Gildå <di98gihe@chl.chalmers.se>
Message-ID: <39E08FA2.71CBD9F7@chl.chalmers.se>
Source record: 56452

Hi!

After having installed STinG 1.26, I experience a much slower transfer
than before. Connecting to my ISP I usually get a 33600bit connection,
and transfers should be about 3300 bytes/sec after that, which is what I
achieved with an earlier STinG version. Now I get around 1800bytes/sec.
I've tried altering the TCP-settings in the corresponding CPX, but that
gives no noticeable effect.

I have these parameters:
MTU: 1500
Window size: 20000
TTL: 128
RTT: 0.050

The RTT was at 1.500 first, but I tried changing it to 0.050, because it
was like that in the earlier version, but it didn't make any difference.

Does anyone know the 'correct' values of these parameters, or anything
else besides this that I should change?

Regards
Henrik Gildï¿½

Sorry, I don't use v1.26, but my settings for v1.15 are as follows:

MTU: 1006
Window size: sorry, can't see that parameter
FRAG_TTL: 60
DEF_TTL: 128
(can't find a parameter of "TTL" on its own)
DEF_RTT: 50
(ditto)

I connect somewhere between 42000 and 45000 each time (with a 56K modem of course!)

>

So I guess it's planned as a music CD. Since only a small percentage of music CDs have an extra multimedia section I guess that even a simple multimedia presentation (HTML + embedded videos) would make the CD a special one.

And btw: make sure you include an autorun file for Windows - otherwise the presentation won't start automatically.

Greetings,
Matthias.

3755. Fun with STiK 2...

Newsgroup: comp.sys.atari.st
Date: 2000-10-08 00:00:00 UTC
From: augeas@elis.demon.co.uk
Message-ID: <39e0c5f62f8860@elis.demon.co.uk>

Does anyone know why STiK2 spits the following at me ?

Port closed for dialer

STiK2 won't acknowledge
the port. Aborting

I booted without the Control Panel, so STiNG CPXs weren't
causing any trouble, I had modem 2 selected on my Falcon. What's
slightly suspicious is that Qdialer refused to find the default
.SCR file in default.cfg without prodding. Does anyone have any
idea what's going on. I for one have finally got the latest version
of STiNG to behave, but I'd like to see if there are any benefits
to be had from STiK.

Both Cab 2.5 and the demo of Cab 2.7 used to get on just
fine at mp3.com. (I'm finally going to get around to upgrading to
v2.8 tomorrow.) Now when I supply my e-mail address and post-code
and hit "continue download" I just get unceremoniously dumped back
at the same page. Is it just low bandwidth, or has mp3.com suddenly
become unfriendly towards CAB ? I'm using the latest versions of
STiNG and Dan Ackerman's overlay, both used to work fine.
audiogalaxy.com still behaves itself.

"Augeas",
frustrated at the lack of new "choons".

Can you mail me this tiff file you have been working on?
If so mail it to the address below.

I've coded a tiff loader. It loads various types and perhaps
I can find some clues. I'm willing to try anyway. ;-)

You're probably referring to a program called Ratrap or similar. I've heard
that it isn't terribly compatible with newer versions of TOS.

On a similar line, I viewed a demo of a utility that allowed menu bars to be
"torn off" and positioned elsewhere on the screen at our last club meet,
however memory isn't what it used to be so I've forgotten the finer detail
(Steve?) :-)

3766. Atari TT030 Info Req

Newsgroup: comp.sys.atari.st
Date: 2000-10-08 00:00:00 UTC
From: BTInternet News <julianlb@btinternet.com>
Message-ID: <8rpcbh$9ie$1@plutonium.btinternet.com>
Source record: 56536

Hi,

after waiting nearly 9 years after their launch I am now the proud owner of
a TT030, being a little rusty I could use a couple of pointers for
information I would like to get my hands on:

Can I swap out the 720K Floppy for a 1.44Mb unit?

Will a CD run on the back? (Where do I find Drivers?)

Did v3.1 of the Spectre application ever get released so I can use TT RAM
under Emulation
If so where can I find it?

Did anyone write drivers for the AppleTalk (Net) Port?

Thanks in advance sorry for the dumb questions, most of the sites I have
found so far don't seem to cover these questions.

Julian

I think Flash is such a popular emerging technology that maybe Web TV
providers may yet put a Flash engine in their machines, but on the
whole I think it is a mistake for any web designer to assume that the
viewer will have exactly the same hardware and software. The only
thing in common between all web browsers is standard HTML. You can't
even rely on a certain font or size of font being there.

>Oh yes I will also look at your page.

Hmmm, be warned, it's not an example of artistic design! But I do try
to keep it as free of proprietary technology as possible and to use
the built-in features of HTML wherever possible.

Hi Matthias,

You verify my worse fears :))

He is the typical musician, fantastic player and composer, but has no idea of the practicalities of CD production. It's up to 'dad' to get familiar with authoring tools etc. I think we/I will stick to HTML, that's going to be hard enough. I feel guilty at not having spent out on a high end PC now!!!

Bob King.

Hi Chris,

your poit re the foolish assumption that a viewer will have the correct fonts
to hand, is one of those attacked by patent applications I have examined. There
is at least one stand alone adaptor available (in US I believe) that auto
compensates.

Bob King.

3770. Reflections about Atari computing future

Newsgroup: comp.sys.atari.st
Date: 2000-10-08 00:00:00 UTC
From: "Francisco L. Fernandez" <flufetor@jazzfree.com>
Message-ID: <39E04F0C.BC1F6B2E@jazzfree.com>
Source record: 56540

Sorry, I post it again without HTML (I hope).

Hello all Atarians,

I follow your newsgroup since some months ago. I began in the platform back in 1988 when my mother bought us a 520 STFM. Then, when I realized its serious computing potential, I gave away my XT and convinced her about buying a 1040 STFM. Later, in 1991 I bought a Mega STE 4 wich was my only computer until 1996. Now I am writting this message in an IBM Thinkpad laptop, altough I haven't left my Ataris, moreover, I bought a Falcon MKX only a year ago that I am configuring with the latest OS and productivity sotfware avaliable.

Having observed very closely all the advances in computing (hardware and software) that took place this finishing decade, specially since the introduction of Windows 95 (as Windows 3.x wasn't really a rival for TOS/Mint/Geneva), I think that Atari platform is still very valid and satisfying for home productivity (that was the market segment it was created for).

Computing is not mainly a question of raw processing power, or making huge amounts of software fill up hugue amounts of hard disk space, is rather a question of having the correct software and knowing about what are your needs and if you have the correct setup to achieve them.
In this sense, each new generation of computers covers a new type of applications the last one wasn't able to do.

Every Atari ST with 4 MB of RAM has enough power to cope with this areas:

* Word Processing (vectorial fonts - WYSING).
* Monochrome DTP (vectorial fonts).
* Monochrome vectorial and raster graphics design (illustration oriented).
* SpreadSheet software calculations and accounting.
* Scientific calculations and plotting.
* MIDI sequencing and processing.
* Low quality preproduction animation.
* 2D CAD (and 3D object design).
* Digitized sound processing and composing (tracking), mainly as of STE.

with very satisfying results.

In addition, the 32 bit "big brothers" (Falcon, TT with graphics card) can do the following:

* Photographic and image processing.
* Colour graphics design.
* 3D CAD.
* Raytracing / rendering.
* Colour DTP.
* Real time audio streaming (Falcon).
* Medium quality animation.
* Basic Internet navigation.

The new clones (Milan, Hades) have improved the processing power for some of the later areas (not sound handling) and are good computers for a "serious" MC68k Unix setup, but can't cope with the new demanding areas and support for the Unix variants (NetBSD, Linux) is not as good as should be desired, not to mention compatibility with old "bad" TOS software.

I think that if we want the TOS plattform running some of today computing uses (digital cinema, MPEG2 recording/playing) is not enough having an accelerated pseudo-clone. For this, new hardware plattform is to be developed, perhaps around power PC chips and using something like the excellent Tempest idea to make run straightforward 68K TOS software. This would need a new version of TOS for these new processors with code translation back support for old "good behaved" software. And not only this: if there are no developers to provide application software for those uses is a nosense to improve the hardware this way. And really do we have such developers among us with enough time and so generous interest, as this surely would not be profitable for them?.

If we can't afford this leap or there is no enough demand for this to be done, I think that our interest should be to have the most compatible machines in hand and warranty that avaliability in the future.

Perhaps a way could be to establish a non profit foundation (primarily of course, it should have to be mantained and pay for hardware design developments added) and obtain from Hasbro, or whoever holds it, the license to build Atari motherboards and also the schematics of them and the design of custom chips. Then it wouldn't be hard nor expensive to optimize the design and manufacture the motherboards on demand and this would asure our future hardware needs. If we also obtained the license to distribute freely and offer limited support for abandoned comercial software we could provide with a real useful platform for a variety of uses perhaps to developing countries or those people (home use mainly) or institutions who can't or don't want to afford the price or complexity of modern computing.

Yes, because software is that really matters and we have a good operating system and very stable, whe should join efforts to renew all TOS software and make it more hardware independant. This is the direction of today aplications as Pixart, Smurf, Eureka, to mention some.

Well, regarding the hardware, our suggested fundation could produce this two computers (motherboards):

1. Mega STE+, a typical Mega STE motherboard with some modifications:

a. The MMU is altered to address the full 68000 16Mb, making the machine expandanble to 14 Mb RAM. Four Mb of these could be shadowed in case of using an VME card.
b. Instead of having cache, motherboard chips and RAM clock can be switched between 8 and 16 MHz.
c. Modified video shifter to allow driver-manageable larger resolutions. I think the easiest way is to expand each resolution to double height and width, having then new 1280x800x2 colours, 1280x400x4 colours and 640x400x16 colours modes. Also horizontal output frequency is doubled to allow the use of modern multisync monitors and provide better vertical refresh..
d. Integrated conversor (like Mario's design) to use standard PC and mouse keyboard.
e. A case is suministrated to retain position of external ports in original design (but video out is VGA standard).

2. Falcon030+, an enhanced falcon motherboard in ATX form factor to be installed in an ATX case and the following improvements:
a. 32 MHz 68030/68882 procesor with full 32 bit address and data bus.
b. Full 32 Mhz RAM and chipset clock.Switchable back to 16 for compatibility.
c. The videl is acelerated to obtain higher vertical refresh.
d. New designed flexible circuitry (intermediary memory control chipset, as I know that the MMU is included in the 68030 chip but the fact is that address lines are limited somehow to access 16 MB only, and data bus wide is cut down to 16 bit) to access Falcon chipset and ST RAM with 16 bit wide data bus, but access with 32 bit wide bus TT RAM, expandable to 512 Mb or more. This should be the key part of the design.

e. Built in Eclipse PCI adaptor circuitry (to be decided if 32 or 16 bit wide), retaining the Falcon expansion port for 16 bit add-on cards.
f. Five PCI slots in ATX positions to allow five PCI cards at once. Some could be:
- ATI Rage IIC or better card (altough this chipset could be on board to share output with the videl and switch it internally), this with fvdi can boast resolution and speed of graphics.
- MPEG2 decoding and TV tuning card.
- Ethernet card.
- USB controller to allow fast USB peripherics connection.
- Power PC daughterboard.
g. As with the previous design, an integrated PC keyboard and mouse convertor.
h. Possibly a full 32 bit expansion bridge for a 32 bit Tempest or CT60 like accelerator.

Well, I don't know if it is possible to obtain all the motherboard components as you have pointed out in some articles. Also with schematics or chips design. This is only a first approach to a way to solve a problem that many of us could suffer in the future: the lack of hardware support.

I hope this reflecions may be useful for some and I'd like to read comments from all you.

Francisco L. Fernandez (from Spain)

Hi Guy's

What make mobile phone do you own.

I ask as my son Lawrence has discovered a APP on the WEB that allows customisation of the display logo, one of the logo's in its library is an Atari logo. Its easy to do, the Logo is sent as a data message to the mobile, it knows about these and stores the data in its display.

Unfortunately, my Nokia is too old to alow this "Upgrade".

Source record: 56542

Hi all!

I've just replaced Extendos with Spin! v0.34. All works brilliantly, including LFNs and I can access a Windoze95 cd I couldn't before.

However I've got a question.:

When I put an audio CD in, Spin!'s doc mentions being able to get .WAV files for each track and PRG files to play them. However I only see the latter.

I think that this is something to do with the BOS driver (I'm using Spin!'s SPIN_SD.BOS). Unless it's to do with the hardware in the CD-Rom.

On a PC at work, NT-Explorer sees .cda files (only 100 or so bytes in size) which I assume is the equivalent of the PRGs (I think this is done by the BOS driver), and not .WAV also.

I'm looking to convert a track from audio CD to MPEG (either on Atari or PC) for a musician friend's website http://www.impala.co.uk (legal for his CD), so can someone suggest a program either on PC or Atari that will enable me to copy a WAV format track from CD?

BTW, I've also got hold of a Cumana CD Rom (external) that is supposed to be SCSI, but the cable that comes out of it doesn't have a normal SCSI-1 or 2 plug on it (I think it was originally used on an Amiga) anyone know if I can use it?

Cheers!

James

On a related subject, OnDigital now have an Internet box out, but of course you have to be an Ondigital subscriber. However, Bush have just lauched an attack on the market
with a range of TVs with built-in web access, also a stand-alone box for use with an existing TV.

At 80UKP for the stand-alone box and no subscription charges (apart from the local rate phone call) it's a very affordable option for the masses to get on the Net. It's almost worth it for Atari users to get a usable web browser! It will be interesting to see how good the box is generally and how compatible it is with most sites.

OK.

Another point to think about is that ALL web browsers (not just those without the capabilities) allow you to switch off images and define your own fonts depending on what you've got available on your machine. In CAB, you could even turn off vector fonts and use the system fonts throughout so increasing speed dramatically. But how many sites are forgiving about having images turned off and unexpected font sizes? A lot will end up in a complete mess.

The XFS displays the WAV files if (and only if) the BOS driver allows to
read digital audio data. SPIN_SD supports this for a lot of drives, but
maybe not for the one you have (which is??).

Hi Bob,

> For the PC these seem to be either purpose written for the PC CD or from PC specific
> programs. Am I right in that either he should buy a PC, or hire a professional to do it
> be content to keep it simple and use HTML or give up the idea. He wants the CD
> to basically promote his music.

Many Multimedia-CDs use Macromedia tools for their multimedia show. Even the Macintosh is often ignored (although the tools are available for the Mac as well).

A show made with multimedia authoring tools can certainly look better than a HTML page. There is also another disadvantage of HTML: even well-written pages look different on the various browsers.

The avantage of HTML is that you can create the pages at home and the authoring tools are cheap.

If he has no experience with authoring tools he should IMHO either hire a professional (can get expensive) or do it in HTML. It may take a while to get familiar with authoring tools such as Director or Flash.

Greetings,
Matthias.

Maybe Didier could put the Flash engine in Aniplayer. OLGA-ID4 support is announced for Adamas and already available in CAB. Adamas has also got an own plugin structure which is currently only used by the X32 player.

SVG is a scripting language (based on XML) so it's not really a different engine. I personally don't think it's impossible but there are certainly more important standards.

interests.

I don't think that Macromedia has a problem seeing Flash on other
platforms. They make their money through selling their authoring tools.

There is an open source implementation of Flash available and even CAB
supports some of the Netscape extensions. Even frames were a Netscape
extension before HTML4.

>
> And in the end, what does Flash offer? How does the use of Flash
improve a page
> to make it more usable and useful? As I can see it only serves to
increase

progress
> any further with your site.

I wouldn't use Flash for a information page but it's also a way to make
multimedia pages work the same on Mac, PC and web TV. Since Flash uses
vector graphics it decreases the download times when compared with a
similiar animation made as an animated GIF.

Greetings,
Matthias.

I just wanted to drop a bit of info on this. The project in this
message is already being worked on for the atari. I think from a
conversation I had recently that there should be some news about it
soon. One big note it requires a fast atari with a good screen
resolution. I shouldn't have really mentioned this as it's not my place,
but I wanted to let people know that someone is already working on it
before we had several different efforts popping up to reduplicate effort.

>>
>> >what is the header of the TIF file? Might be able to match it with
>one of mine
>> >and then at least know what we are dealing with.
>>
>> GEM-View spits out: "unknown data compression algorithm 0 (0x4)."
>
>Can't help with the header, but FWIW, they are multi-page CCITT TIFFs,
>apparently a format designed for faxes. This question has been raised a

I was getting quite determined to nail this problem, so I
started throwing some C together. The .tiff file I've been working
on has 17 12-byte image file directories (IFDs), here they are:

Number Tag Type Count Offset
0 256 3 1 1728
1 257 3 1 2282
2 258 3 1 1
3 259 3 1 4
4 262 3 1 0
5 266 3 1 2
6 273 4 1 8
7 274 3 1 1
8 277 3 1 1
9 278 4 1 -1
10 279 4 1 4563
11 282 5 1 4782
12 283 5 1 4790
13 284 3 1 1
14 296 3 1 2
15 297 3 2 65537
16 305 2 9 4798

The third tag, 259, indicates the type of compression. Like
GemView said, this has a value of 4, completely undefined in the
tiff 6 spec. Gemview also agrees on the dimensions of the image,
1728x2282. Tag 9, 278 indicates that the whole page is expressed
as one strip. Tag 6, 273, has an offset of 8. This is ludicrous,
as it's meant to point to the compressed data of the 1st strip.
Both the tiff 6 spec and the tiff class F spec that deals with faxes
can be found at:

ftp://ftp.faximum.com/pub/documents/

There's no mention of what a value of 4 for the compression
tag could mean, and I've no idea what happened to the strip offsets.
Does anyone[1] want to help with the fight ?

"Augeas"

Mario, still want that .tiff file ?

Hi Thomas,

I'm not grumbling at MausWindow's speed per se. I used it on my MegaST4 and found it very very useful.
The Milan however is so quick in activating a window, that I'd rather click to activate than move over and wait.

Bob King.

I don't consider a machine done if it has no OS. If it's not
on a store shelve then what good is it? That is just a straight
forward question. If you wish to call that a done project
I guess that is your option. Anyway I retract anything I said
that might of been harmful to his reputation. I was overlay
critical. Bottom line is I am simply not interested in such
a product and I should of left it at that. ;-)

Thanks, it worked. I held down the Alt key before the memory check started
and then the 'A:' drive kicked in. Loaded first time.

Thanks to all.

Chris.

Hi,

I've been having a problem too. I have had great success with Stik 1.12 since I got on-line a few years ago. I saw the update mentioned, so I thot I'd give it a try. It _almost_ works for me. Here's what happens:

It goes thru the login procedure just fine. When it gets to the "get IP address" part, it gets the address, but then it says: "Reading Address", then "Invalid Address", then it logs off. I suspect I've got one "tiny" thing set wrong, but before I spend many hours fiddling around and not being really sure what to do, I thot I'd ask here to see if any others have encountered this situation.

I'm still using my original SLIP connection, and have the new script set to SLIP. I'm using a Falcon/14meg/TOS4.04/Nemesis/ Warp9/CAB2.7/ Newsie.96/ I have Nemesis and Warp9 deactivated just to take those possibilities out of the equation.

Thanks for any input,

Clayton Murray

Try holding down the "A" key during bootup. This seemed to work on a
friend's TT who also had TOS 2.06.

Hi all-

Has anyone else had a problem with the new dialer for Stik? It is QDIAL 37, and was just recently put up on the Stik page. It locks up my computer whether run as a program or as an accessory. I have a Falcon with Nemesis/ Warp 9/ TOS 4.04. I ran it in a partition that has both Nemesis and Warp 9 disabled, but still... kaboom! I also tried downloading it again, but no difference.

Thanks,

Clayton Murray
Seattle, WA USA

Yes, if you have TOS 2.06. TOS 2.05 will not work (though you could
upgrade that as well.

> Will a CD run on the back? (Where do I find Drivers?)
Yes. Standard SCSI. There are several drivers available. I use and
enjoy Extendos by Anodyne Software, which is commercial.

RAM
> under Emulation
> If so where can I find it?
I think so. I'm not sure.

> Did anyone write drivers for the AppleTalk (Net) Port?
No. However, you can use STing and use that port with a TCP/IP stack.

If you are asking about the useless 30 second intro, I'd say that you
would have to link ray traced images together into a movie. As for the
website behind the intro, it's pretty standard stuff -- an Atari should
have no trouble.

Another solution is to hold down the right mouse button while selecting
items. This allows for the use of frames not the highlighted one.

(Note: This may not be in early TOS versions.)

Ken, I understand that you are "desperate", but from there to preach a
certain person like rodolph. He ain't god, he ain't god at all.
I have a hard time seeing you putting your trust into this guy.
Anyway:
you are changing, or rather rewording the truth.
The simple fact is:
out of the "CENTEK" real production, the ct2 is the only achievement along
with a few low quality software. The ct1 (like the nemesis or Phanthom)
was designed and already sold in france before we heard of centek by oxo
at the time (who designed it really? there are stories contradicting each
other, it appears that no one is really clear on that).

A product, advertized, if abandoned will become what? vapourware. *Ding!*
As simple as that, who cares about the fact that ibm didn't want to
produce bolts to hold the case together, the simple fact is that it has
never come out to the public, hence vapourware, something nobody has
bought, touched, or even seen. The closest the phenix has been seen was
with the guts out with a screen showing a test pattern (color target). Now
that was impressive.

CT2 product, where's the OS? Have they said anything about buying NVDI?
(after all, that's 100 bucks more right there). Where's the PCI bridge
that was supposed to be there? Anyway, a lot of vapourware and somewhat
the ct2 made it out, a tad crippled from what it was supposed to be.

I won't even mention again that half of the ct2 are out of service.

Deesse, what's about that? a PCI sound card, whoao, like such things don't exist already. Is it out? why hasn't he sold the design to Diamond Multimedia, Creative-Labs and such? why for? for the love of atari he wants to stay here? hell no, 50% of the few atari users left hate his guts, and he hates atari hardware, software, developers and users. (don't contradict me here as i know exactly what I am talking about).
This guys doesn't make any sense.

> I don't recall the Rio card being Rodolphes project, he has info on it,
> that's all.

It sure looked like he was BIG part of this project.

> so, out of 5 projects, 3 are done. One was offered previously but

I know this. But everyone wishes to ingnore the fact that
it remains useless as just hardware. Why bother to post specs
and so on if only to raise false hopes. Since not too many saw it
even function I don't see where it carries any weight.
I also don't see someone taking up the job to finish an OS unless
I've missed some big announcement. That is just what I see as the
obvious, only my opinion, and I'm sure I completely wrong.

If there's a choice, I'd go for the LookII. It's more compatible with
modern SCSI devices than the earlier version, however I don't have any
info to hand to back that up with solid fact.

Even better would be a Link97.

NTL's Interactive TV web browser will only allow access to a very
restricted range of sites - basically, because the resolution of a TV
is so low that most if not all sites would be totally unviewable.

I certainly wouldn't waste any time or money in going this route. One
would be much better off sticking firmly to browsing with one's Atari
(phew, back on topic).

Hi John,

I was feeling kinda smug (the pride before the fall). I read your
original posting and thought " I wonder what he did wrong ".

Then on the 6th, CSAS started adding extra messages to my listing,
like yours they were duplicates of the first message in the list,
10 of them and next day twelve, I had cleared the base in between.
Highlight any of the dups and they all lit up. Delete one and they all
vanished to be replaced by the new message from the head of the list.
? Again it only affected CSAS which was not even my biggest base.

I am using Newsie 0.96 with STik, on a Falcon. My ISP is Zetnet.

Today (8th) I was going to play with the Threads to see if I got the
same as you BUT when I booted up today all duplicates have vanished.
They were there last night but not this morning, ???? I have done
nothing to any settings at all. oo err pass.....

Regards Colin Doc

There must be a conflict, anyway, because with the doubler and Network
Card AND Crazy Dots installed both the Nic and the C-Dots work
separately fine - but not together. With the graphics card drivers
first loaded, the PAM VME Card won't be recognized.

>Is it possible that the cables of the adapter are just too long?
The cables of my VME-doubler are about 40cm long. But, as I installed
the doubler the first time, nothing happened. As I checked the
crimping of the cables, I realized that there was a real bad crimping.
So I crimped that stuff again - everything works fine.

BTW: With my Nova card I have the same effect: blue stripes or/and
half screen size: after pressing the card strongly into the VME-Slot
the stripes will disappear.

Hope that helps

Jochen

OOOh! lovely subject:)

You didn't mention what model Atari you are wanting to run it on!

There are some ways around awkward games, ideally if they will run
within GEM you have a better chance:)

9 times 0f 10 the games etc. fail due to the copy protection techniques
employed, RNC protection is a typical and may not run on an STE even
when stated; RNC protections can also fail due to some disk drives!

The only way to get these type of programs running is by
removing/bypassing the protection. I'm not sure if hardware like
Multiface ST may be of use here!

The first I would is find out if the software is a STOS game or not, if
it is then use something like STOS fix to patch the software to work on
YOUR machine.

The other method is to load a disk based TOS, I use 1.09, this usually
does the trick, I've used this method on some really hard to run
software, software that FAIL to run on any STFM/STE TOS and was suppose
to be a TOS program (not runable from outside the AUTO folder!).

If you rally get stuck and are desperate, get in touch via email:)

Hi Folks,
My wife is currently clearing out the loft and has found a large number of Atari Magazines which she is very keen to re-cycle. However her idea of re-cyling Atari Magazines is to send them to the local scouts for re-pulping.....

Any way there are some START mags, ST Format, ST World and ST Applications (I think thats what they are called. UK User group stuff).

If they are of any interest to any one, and they are willing to collect them from the Manchester area drop post in here with an e-mail address (suitably concealed from the SPAM monsters of course) and I will arrange a suitable time to exchange them.

Dave Wade.

Sent via Deja.com http://www.deja.com/
Before you buy.

3815. Maus-Window not working...

Newsgroup: comp.sys.atari.st

I was sent Maus-Window and I put the .ACC file in my ACC folder on my Falcon. It doesn't work. It's supposed to be accessible from the desktop menu but all I have are the regular control panels.

SafeMenu works like a charm, by the way. Any ideas why Maus-Window is failing on my Falcon? I'm not running anything strange...Winx 2.1, no MultiTOS, 4 mb ram. I've installed it several times with no luck.. A small cli accessory I've downloaded and installed doesn't work either so I'm wondering if something is amiss.

Thanks....

Hi Tony,

I sent it to you and checked it and SafeMenu on my Milan, but not
Falcon. Strangely, MausWindow worked, but the topping of the window was
so slow that for the Milan it's no go. On the other hand SafeMenu
installed as an ACC and the menus droppeddown etc but the cursor and
whole computer froze. I think that the lesson is that programs of this
vintage only safely work on an ST.

Bob King.

"Augeas" - it sounds like you didn't change the modem number in the STik CFG file. As the file comes it is set for Modem 1 - change only the "1" to "2" and make sure that you do not change the spacing. This may sound like a dumb question, but do you have Qdialer and the CFG files sitting on your boot drive or another partition. If it is on an other partition do you have a redirect script on the boot drive to point STiK to the proper folder where the CFG files are located?

As far as benefits - I have noticed that with CAB and the latest OVL from Dan that I do not get the "time out" problems and missed graphics that has always been a problem for me when using any version of STinG. The only reason I used STinG was that I needed PPP support. Overall speed seems to be about the same for both.

Remove all of STiNG, kernal, CPXs, and dialer.(keep a backup of those
SCR files though!) Are you using Modem 2 port?

>What's slightly suspicious is that Qdialer refused to find the default

The default.cfg and ppp.scr should be in a folder on the root of C
called default_cfg

Surely that should be STIK_CFG (see below):

_____
You need to create a STIK_CFG folder (directory), this can be located on your
boot disk. Either C: if you have a hard drive or A: if you have a floppy only
setup. If you do not want to create a folder on your boot drive, you can create
a text file called STIK_DIR.DAT, this file will simply be one line that gives
the path of your STIK_CFG folder.

Copy DEFAULT.CFG and your default dial script to the STIK_CFG folder.

I can't say much to the original problem (sure that the Falcon loads the .ACCs from the directory mauswind.acc is in?), but for "topping was so slow": By default, Maus-Window will delay topping for some 10th of a second (3/10, IIRC), and only if the mouse cursor is stationary. If you want instant response, uncheck the appropriate options (don't recall their exact names ATM).

Ciao

And so they were. Unfortunately, there was also an old file
from the installation of the original STiK that pointed away from the
folder. Doh ! Everything works fine now, but MP3.COM still refuses to
cooperate :(. It's too early to say whether it's any faster or more
comppatible than STiNG, but it's certainly easier to set up. For
what it's worth, I got STiNG to cooperate by leaving the CPXs well
alone, they kept wanting to set my I.P. address to 0.0.0.0. I
certainly miss the login.bat file launching POPWatch automatically.
I think the STiK/STiNG/MiNTnet competition is decidedly healthy.
Mean while, back to hunting down alien tiff tags...

Hi!

The following URL:

http://cgi.ebay.co.uk/aw-cgi/eBayISAPI.dll?ViewItem&item=463557509

Is where I am selling Philips monitor - an RGB CM8833 Mk.2 with no leads.
Check item description for info. Starting bid is £15.

Apologies if this post is in an irrelevant newsgroup - I have posted to newsgroups to do with computers that the monitor would be useful for. Please note: This is *not* a VGA monitor or a multiscan monitor - it's a simple RGB one.

Selling it because it's taking up space and my Amiga 1200 doesn't work anymore. :-) Used to have a RGB lead for it (DIN to DIN) but I chopped it up to make my Amiga work with a VGA monitor... I'm sure these leads can't be that hard to find on the web.

Cheers,

Jeremy.

Oops, not only did I post this twice, but the value of 8
isnt ludicrous, just rather peverse. The data starts from the 8th
byte, just after the header, with IFDs tacked on the end. Strange,
but legal. Still no idea what a value of 4 for compression means,
though.

1?
CenTurbo1 and CenTurbo2, done
Phenix, done (hardware done, dev machines shipped, only software
(os) dropped out)
Deese, done (but dev for Milan2 I believe, if Milan2 doesn't ship
is this Rodolphes fault?)
this leaves CT60, the original and revised formats, and
CTT as *potential* vapourware.
I don't recall the Rio card being Rodolphes project, he has info on it,
that's all.
so, out of 5 projects, 3 are done. One was offered previously but
did not see the light of day (the TT one), and the CT60 project has been
scaled back. The TT project _may_ be considered vapourware, but
the CT60 project cannot yet be considered that unless you want to
consider a *lot* of atari projects vapourware! (fenix, tempest, xaaes,..)
hey, for me Lonny the glass is half full,
I guess for you it is half empty! :-)

: >Is it possible that the cables of the adapter are just too long?

: Quite probably. The TT's VME bus has quite weak buffers (not conforming to
: the VME bus spec), and adding additional (capacitive) load (either a long
: cable or a second connector plus card) can easily lead to timing problems.

: >I did install the orinal VME card again and with this the Crazy Dots works
: >without any problem.

: You could try shortening the cables as much as possible.

Ummmm. The timing signals, according to my service manual, come from
U702 and U703, marked as PAL16L8. The data and address data comes
from U705-U710, which are 74LS244 and 245 chips. One historical
work around for low current and high impedance has been to simply add
another chip in parallel by soldering it on top of the first one.

That was tried and worked in the case of the hardware version of
PC Ditto, which otherwise crashed on takeoff.

I have not tried this, but may someday, because I want my TT to
work like that. This is not a recommendation, your mileage may
vary, your rights may vary from state to state, and all that
jazz, but still there is no reason that should not work and should
not hurt.

What is the part of the signal that is puny and weak and has
indefinite levels?

> software.

One of the main reasons for "bad" software is
rooted in the history of the platform. There
was often no alternative in order to produce
software that was responsive enough to be
useable. Now computers are so much more
powerful, more effort should be put into
developing software cleanly so it will remain
useful on future generations of machines.
I would rather have a piece of software that
will work 10x faster on the next machine,
and 100x on the one after that, than one which
is hard-coded in order to achieve a quick 2x
speed boost on the current machine but will
never work on another machine after my current
one has served its useful life and the software
itself is no longer updated to work on the
new hardware (familiar situation?).

> I think that if we want the TOS plattform running some of today

It's called 68K emulation. Apple did this years ago.
Doing quite well on PPC machines now.

> optimize the design and manufacture the motherboards on demand

That's crazy. Manufacturing hardware on
demand is about the most expensive way
you can go about it. You have to make
these things in the thousands to be viable.
As for it not being difficult... It doesn't
get harder than having to understand and
modify something you didn't design yourself.

> Well, regarding the hardware, our suggested fundation could produce

> b. Instead of having cache, motherboard chips and RAM clock can be
> switched between 8 and 16 MHz.

In that case you need to re-design the
chips so they can all run reliably at
the higher speed. Even Atari didn't
see the sense in doing that, hence the
easier option of using a cache.

> c. Modified video shifter to allow driver-manageable larger resolutions.
> I think the easiest way is to expand each resolution to double height

> a. 32 MHz 68030/68882 procesor with full 32 bit address and data bus.
> b. Full 32 Mhz RAM and chipset clock.Switchable back to 16 for
> compatibility.

Apart from 32-bit address, this is no
improvement on a CT2 accelerator,
and what Atari software is going to use
32-bit address space? The chosen
processing and I/O systems would
never be fast enough to make that
amount of storage practical in use.

> e. Built in Eclipse PCI adaptor circuitry (to be decided if 32 or 16 bit
> wide), retaining the Falcon expansion port for 16 bit add-on cards.

PCI is 32-bit. There are no Falcon 16-bit expansion
cards which offer any functionality that cannot be
bettered in quality, performance and price by modern
32-bit PCI expansion cards. What 16-bit Falcon
expansion cards could be of use today? Some old
and slow RAM boards, 386 PC emulators, a couple
of video digitisers.

> f. Five PCI slots in ATX positions to allow five PCI cards at once. Some
> could be:

ATX has 7 slots for 6 ISA/PCI and 1 AGP.

> - ATI Rage IIC or better card (altough this chipset could be on board to

Why, because this is what happens to
come with Eclipse?

> share output with the videl and switch it internally), this with fvdi
> can boast resolution and speed of graphics.

> - MPEG2 decoding and TV tuning card.
> - Ethernet card.

Few people buy a computer to watch
TV (strange, but true). Things like MPEG
in hardware are only for fixed-purpose
appliances like DVD players (even then
you'll find it's most likely done by a
high-speed general-purpose DSP with
fixed program code). They make
no sense these days on general purpose
computing systems, especially as new
CODEC algorithms are being developed
all the time for different purposes and
modern CPU/DSP can handle these in
software, reducing the frequency of
hardware upgrades. That is, unless you
running a pedestrian 32 MHz 68030.

The scope for functional synthesis in the
digital domain is enormous and far
surpasses the limited feature set of
custom hardware. The best computer
audio cards nowadays don't have
built-in sounds or programmable
oscillators and filters, they simply have
masses of DSP power to allow the
creation or manipulation of any sound,
in real-time.

> - USB controller to allow fast USB peripherics connection.
> g. As with the previous design, an integrated PC keyboard and mouse
> convertor.

If you were designing a PCI machine, these
two would be part of the PCI core logic.

> h. Possibly a full 32 bit expansion bridge for a 32 bit Tempest or CT60
> like accelerator.

CT2A had a full 32-bit expansion bus two
years ago and nobody had the sense/foresight
to make use of it. A totally new machine should
be using PCI as a 32-bit expansion bus anyway,
not a proprietary design. The market is now so
small, the cost of developing expansion cards
would make the price higher (and Atari users
would complain even more than they already do)
as well as restrict the range of cards available.

> Well, I don't know if it is possible to obtain all the motherboard
> components as you have pointed out in some articles.

The only components you'd have difficulty
obtaining are the custom chips, and you
wouldn't have custom silicon made in small
quantities, it's expensive. You'd implement them
in modern high-speed programmable gate arrays
(the same things which make possible the
development of minority machines like Hades,
Milan and Phenix).

> Also with
> schematics or chips design. This is only a first approach to a way to
> solve a problem that many of us could suffer in the future: the lack of
> hardware support.

When dreaming up your ideal Atari machine
it's easy to take an existing design, and add
in various existing solutions (which are
sometimes compromises on the technology
they bridge to) and pull some nice-sounding
numbers out of thin air. If you were to draw
these on a functional schematic, you'd end
up with a real mess.

For example, on a new machine, sticking a
32-bit PCI bus on top of a 16-bit architecture
where the CPU also resides is self-defeating
because you introduce a bottle-neck. Just
because Eclipse works this way, doesn't
necessarily make it a good solution for a new
design. You're thinking upside-down.

run
> some of my old games from the 'A:' drive, the type that bypass GEM.

You could hold down [Alt] to disable the
hard disk driver or [Control] to boot
the hard disk but not load AUTOs and
ACCs. In any case, non-GEM games
will autoboot and your Atari boots from
the FDD before HDD.

You may find your real problems may
be caused by TOS 2.06 itself. My TOS 2.06
Mega STE refused to work with two
commercial games whose demo versions from
ST Format worked fine (Magic Boy and
The Chaos Engine). I returned Chaos Engine
to the shop, but was able to play Magic Boy
on my 520STFM (albeit with non-STE
sounds and visuals).

Years later, I was able to borrow some
TOS 2.05 chips, and Magic Boy then
worked on my Mega STE. I had to return
the 2.05 chips, and by chance, the person
who lent them to me happened to have
a developer version TOS 1.4 on floppy.
I gave it a try and bingo, this also had
the same effect. There was obviously
something about the disk I/O routines
changed in TOS 2.06. Using 1.4 allowed
the game to get over that small hiccup,
and load up then play as usual, including
STE enhancements.

If you've upgraded to 2.06 then it's most
likely you're a 520/1040 user, in which
case you should have bought a switchable
upgrade, to allow two operating systems.

I bought mine in 1991. I had to change the floppy controller. The old one couldnt handle the doubled frequency. And yes, I had to upgrade from 2.05 to 2.06

What I can't figure out is why TOS wasn't ported to the Intel or Mac hardware standard long ago. Granted, all new drivers have to be written for most things, but I'd love to see something like Linux users enjoy -- pick your machine, but run TOS rather than Windows.

MagicMac is the closest we've got to this idea, but if MagicMac can be purchased from someone who speaks English, I don't know about it. Every US/UK supplier appears to be out. (Someone...please prove me wrong!)

This is also a feature of Geneva. Hold control and click on an item on
the menu bar. Occasionally useful when you have to repeatedly use an
item without a keyboard equivalent.

:) My thoughts too.....:) Amiga dealers are dry here, and last year Centek asked me where in the US they could be found. Maybe the Germans have some hidden, or so they would like us to believe:) (You would have to watch Norm McDonald to think that was funny I guess:)

Diving into this conversation a little late...

Firstly I'd like to second just about everything Chris has written so far in this thread.

"Chris Simon" <osian@zetnet.co.uk> wrote in message news:39ded5b3$0$8005@news.zetnet.co.uk...
> On 6 Oct 2000 22:52:30 G, Bob King wrote:

> in images, and knowing when *not* to put ALT tags in images.

Exactly: it's often as easy to do the thing properly so the site works for everyone as it is to mess it up for everyone who doesn't have broadband and a supercomputer.

There is an added incentive to start doing it right in the UK in the form of the Disability Discrimination Act: where an organisation's web site is an integral or major part of its service, it now has to be accessible to disabled users. Easiest way to do it is to follow the W3C accessibility guidelines, at least as far as getting up to "Bobby Approved" status (Bobby is a validator which checks your web pages for accessibility - http://www.cast.org/bobby/).

The interesting (but entirely predictable) thing is that there is a considerable amount of overlap between the techniques/practices you need to use when designing accessible pages for disabled users and the techniques/practices needed for mobile/PDA/TV/whatever access. Which boils down to either writing pages which degrade gracefully to match the browser's capabilities/user settings, or doing an all-singing all-dancing site but maintaining a text-only version too.

I've spent the last six months developing a new web site for work where we've tried to make it as accessible as possible while still satisfying the people who want it to look good, and by and large it's succeeded (though I say it myself). It may not be particularly good-looking on browsers with no style sheet support, but it is usable on text browsers up (we used Lynx as one of our test browsers), including CAB (I did a little unofficial testing at home!). We also cut out unnecessary

graphics etc and concentrated on getting *information* across and making the navigation quick and easy. It's at:

http://www.mmu.ac.uk/services/library/

I also try to follow the guidelines for my own site at:

http://www.bygjohn.co.uk

... though I allowed myself the luxury of an oversized graphic on the front page!

This kind of web design isn't particularly hard, it just requires some thought about how the site might be used and focusing on the content rather than gizmos.

Jakob Nielsen has some useful ideas on usability and accessibility in web design, too:

http://www.useit.com (that URL's from memory, though)

All of this stuff can be accomplished with CAB and a text editor, though it's hard checking CSS with a browser that can't display it.

Just my tuppenceworth...

Perhaps a switch to Okami is in order? You set up the kill filters as
part of the import process, IIRC (it's a while since I used it). I admit
the learning curve is pretty steep with Okami, but it's a remarkably
powerful mailer/newsreader used in conjunction with POPwatch/NEWSwatch.

Just a thought, do with it as you will!

I think you'l find its TOS 1.62, some software reports the TOS version incorrectly
due to the way Atari wrote the standards and then broke them.
You probably have TOS 2.06 in your MegaSTE anyway, which is the equivalent.

If you have an AJAX chip already then you can just substitute the 2.0 Meg unit with no further mod's, if you dont have an AJAX then you need one of these and maybe a GAL chip depending on what motherboard you have. You'l also need to flick a DIL switch if you retrofitted an AJAX.

3860. Maus-Windows Working Now...

Newsgroup: comp.sys.atari.st
Date: 2000-10-10 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1001010041136.28704B-100000@halifax.chebucto.ns.ca>
Source record: 56423

I got Maus-Windows and my CLI program working now. It seems the Falcon is not looking in the ACC folder and will only load .ACCs that reside in the root directory. Anyway I can change this?

Also by unselecting mouse movement in the options, Maus-Window is very fast at switching the top folder even with the mouse in travel. Now comes another related question...

Is there a program (possibly accessory) that allows random placement and movement of windows and their folders. Currently when I open C: and then a folder within C:, and possibly second folder, they all stack on top of each other, making interaction among the materials within the folders difficult. I am forced to open the C: drive again and again in order to have the right folder windows open at the right time. This is very time consuming and there should be a way to separate the stacking of the windows so that they open in different locations and the operator can move them to their preferred position. This is the way the Mac does it and it makes for much faster file action. Anything like this for the Atari?

Thanks...

3861. Odd Falcon character set...

Source record: 56424

One of my 2 Falcons has an odd quirk - several keys are reassigned.

The shifted 2 key doesn't produce an @ sign. It is assigned to the shifted ' key and the " is assigned to the shifted 2 even though the keys are properly marked.

The ~ key backspaces even though the Backspace next to it does the same thing and my backslash key (when shifted) produces a tilde. The unshifted backslash key produces a # sign and when I shift the 3 key, I get a message 'Unknown command ^ backslash' from my terminal program so the key obviously is producing a control-backslash keystroke rather than a regular backslash keystroke.

So far I have no backslash nor pipe command key even though they are clearly marked, they produce the above marks. I only noticed the assignment problems when going online and using the cli as I don't use thesde keys normally in my daily Falcon use. The other Falcon has normal key assignment.

Is there a way of correcting this reassignment nightmare?

Thanks...

Sounds rather like you have a European TOS, whose keyboards tend to
differ in certain areas than North American versions. I'm sure there
are probably keyboard mappers out there, but I couldn't name any
offhand. The only other solution is to replace the TOS chips with
North American ones.

Use Bootconf or a similar tool to select US keyboard layout. It sounds
like you have a UK layout.

Hi!

Few questions about freemint with stik.

I'm trying to use Freemint 1.15.5 with STiK2. I have a minimal setup, Spin! as CDROM driver, HDDriver, STiK2 and FreeMint with no extras apart from the Spin XFS. (all booting off J partition, hold down J to boot Mint, C to boot TOS!)

Without STiK installed all filenames are in capitals, but with STiK it they're all little letters. (sorry I've forgotten which is upper and lower case).

So when it gets to loading Qdialer as an ACC (haven't got around to installing XaAES!) Qdialer reports it can't find the QDIAL.RSC.
Is it because it's looking for the pathname in captials?

What would be the best Mint setup for my STE (see sig for my extra goodies) or should I just use Magic.

Kellis seems to think KEMD is the best, but I think she's forgetting not everyone has Falcons. I don't like the way she mocks Magic.

I really don't know how you guys get Mint running so smoothly. Anyone know what essential pieces of software I should have to improve Mint, apart from Spin! XFS.

Thanks in Advance!

>Is it possible that the cables of the adapter are just too long?

Quite probably. The TT's VME bus has quite weak buffers (not conforming to
the VME bus spec), and adding additional (capacitive) load (either a long
cable or a second connector plus card) can easily lead to timing problems.

>I did install the orinal VME card again and with this the Crazy Dots works
>without any problem.

You could try shortening the cables as much as possible.

>> http://www.epsrc-sciencerace.net/schools/534121/

For what it's worth, I had a look at the site in work using Netscape.
It has a nice, if standard, Flash intro - but the problem with Flash
is that once you've seen an intro like this you don't want to see it
again, and probably wish you'd never seen it in the first place! the
rest of the site is a pretty standard, enatly presented series of
information pages.

I wouldn't say it's an example of good web site design. As mentioned,
the use of Flash is questionable and there's nothing to distinguish
the rest of the site from anything else on the web. There's nothing
to make you want to go back and visit, and the nature of the content
means that it is unlikely to be updated frequently.

As a school exercise, full marks. But in the wider scheme of things,
it's pretty low on my list.

To create an animated intro like Flash does, you could do it on an
Atari suing readily available programs, or even create a sequence and
convert it to an animated GIF. At least it would then be accessible
to all platforms.

OK. To be in accordance with what you
say, it seems that TOS only
pretends to access my SyJet cart. Since
there is a 1.0 GB limit
under TOS, Magic, BigDOS or MiNT, when I
partition my SyJet cart
under TOS-DOS this means that I can only
create one 1.0GB
partition on my SyJet 1.5GB cart!? as I
am restricted to one
partition/drive(cart) under TOS-DOS.
Seems a shame to leave 500MB
unformatted(unpartitionned0! :-(

TOS 2.06? Mine has 3.06! And, besides plugging in a 1.4 meg drive, you
should set DIP switch position 7 to "on". There is only one DIP switch
in there, and it is the front right corner of my TT main board.

The others do not do anything unless you write a program to use them.

This is one thing that I missed in the docs. Don't send unedited qdialer logs to people. Repeat don't send unedited qdialer logs to people. Reason, on many systems you will hang up there modems when it gets to the modem hangup logging. It is logged to verify what the person is using for hangup, so it is used however...

If you want to send a log file of a dial attempt do one of the following remove the line that shows the hangup or compress the file as a ZIP or LZH. This will avoid the problem.

Sorry for any inconvenience my lack of putting this into the docs may have caused.

Dan Ackerman
aka baldrick

3883. [Ebay] Philips CM8833 Mk 2 RGB monitor on Ebay

Michael,

You are not the defender of the charter for every group you can find.
You are not the number one net.cop. You are being an idiot. Why are you
attempting to direct further responses to alt.test?

Stop chasing every eBay post with a little whiny fit. If you want to
complain, complain. I'm sure eventually someone at eBay will killfile
you for the whinger you are.

I hardly think that one of the most popular monitors available for the
16-bit home computers covered by the groups is 'off topic spam'. I have
left the two most relevant groups in place.

For those who missed it:
http://cgi.ebay.co.uk/aw-cgi/eBayISAPI.dll?ViewItem&item=463557509

Start bid 15 UKP.

No, it's not mine. For the Atari folk who may not have seen Michael
before, he hides in the Amiga hierarchy and picks on eBay adverts - a
recent one would be an advert for an A3000 system (like a MegaSTE, IMO)
advertised in, of all places, comp.sys.cbm (CBM being... Commodore
Business Machines). As much as everyone loves to hate eBay, I think this
incessant complaining to eBay about what are relevant adverts is simply
moronic.

Unfortunately there's no options to click as the program doesn't work at all. At least if there was a dropdown box with otions, it would be a start. I have ACC directory in my root directory that the Falcon loads from.

SafeMenu works well providing you don't run anything, Once you run a program and then exit from it, the dropdown menus are back to normal as if SafeMenu wasn't installed. Strange.

The CLI program (an acc also) doesn't show up in control panels either. SafeMenu is only working as a PRG in the AUTO folder. I tried the ACC alone and it wouldn't load either.

Hmmm?!

I don't know of anything that patches the TOS desktop. Most people
simply use another desktop like Thing or Jinnee. I myself use NeoDesk4
(alsong with Geneva) which solves every problem you've asked about over
the past few weeks (no long file name support, though).

TOS 2.06 should handle 512 MB without a problem. I know that TOS 4.04 can handle 1 GB, but I'm not sure about 2.06. The ICD software will default to a huge bunch of 32.something MB partitions, and truth to tell, there's still the occasional old program that expects a GEM partition, so I recommend making C: 32 MB. Then hand edit the setup to make the others up to 512 MB (these are called BGM partitions). You will also need to edit your autoboot file to account for the new partition size (I think it's called HDTOOLS.PRG?).

Let me know if you need any help.

Galen

P.S.: With 32MB, the sector size (essentially the size of each storage 'chunk') is 512 bytes. This means that even if you write a tiny two word text file to disk, you still use 512 bytes of space on the HD. As things grow...

up to 64MB -- sector size is 1KB
up to 128MB -- sector size is 2KB
up to 256MB -- sector size is 4KB
up to 512MB -- sector size is 8KB
up to 1 GB -- sector size is 16KB (I think I've got this right)

Consequently, that same two word file takes up 16KB of space on a 1 GB partition. Although 1 GB is so much room most people don't care, I'd recommend (for example) dividing a 750 MB drive into 32, 206, and 512 MB sectors as opposed to 375 and 375 MB. You just get a bit more storage that way.

The latest version of ExtenDOS displays
WAV as well.

Depending on which version you have,
you might be able to use the free updater.

> I'm looking to convert a track from audio CD to MPEG (either on Atari or

> enable me to copy a WAV format track from CD?

The CD audio utility from ExtenDOS will
export as AVR, AIFF and WAV. I think
Alexander Clauss' CD Player will also do
these, and has more sample rates as well
(though ExtenDOS' CDAudio program
will create all sample rates to match
Atari-specific ones such as in the STE
or Falcon).

I bought mine in feb 1991. Unfortunately I threw away the cabinet. They
could be twins. :-)

The most important componant, silicium, is forged in supernovae somewhere
between 5 and 10 billion yewars ago.

So there is enough reason to hope that your TT could easily last onother 10 years.

> upgrade that as well.

You can use HD-drives with all TOS-versions, as long as you make sure that the steprate is halfed from 3ms to 6ms. Anyway, TOS 2 won't work on a TT, I guess you mean TOS 3...

Btw. my TT does not have an Ajax, but I'm using a HD-drive anyway. It's not perfect (I occasionally get some write-errors on the last 10 tracks or so) but I almost never use the floppy anyway so I don't care.

>from my Falcon. However, AHDI does not detect the drive.

If you have ICD software use that instead of AHDI. You should also make sure that you partition the drive to be AHDI compatible (when using the ICD utility software).

>I don't particularily want to shell out money for HDDRIVER if it is not
>going to fix the problem. Am I missing something obvious?

You can grab a demo from Uwe Seimet's web site.

>One thing that strikes me as weird is that I definetly have the drive

The LUN should be set to 0, I assume that you've set the SCSI ID on it to 0 (ie removed the jumpers from the jumper field associated with setting ID's, or adjusted the switch)?

3912. Folders resetting...

Newsgroup: comp.sys.atari.st
Date: 2000-10-11 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1001011051316.21181A-100000@halifax.chebucto.ns.ca>
Source record: 56382

Is there a way to defeat the auto-reset feature of the folders on the ST and Falcon?

By auto-reset, I am referring to the way the previous folder goes to the top of the alphabetical listing when you back out of a sub-directory. If I am working with several folders down towards the bottom of the list and I back up one level, the folder list goes to the top of the window listing and I must constantly scroll down to the folder I was working on to re-enter it.

Is there a program (possibly accessory) to defeat this feature and make it return to the exact point you were at when you entered the sub-directory? It is very time consuming when working with large directory listings and lots of folders and would speed things up if there was a way to defeat it.

Thanks...

3913. WTD: ST Ram Upgrade for a TT

Taken from atari.org

According to a statement on the Milan Computer homepage (see link below), the development of the Milan II has been discontinued because one highly relevant custom-chip, deeply integrated in the motherboard-design of the Milan II, is not being produced against all expectations.

Currently it is not decided yet wether to continue and develop a new board design or to focus on porting the MilanOS to other platforms.

The statement being referred to is currently only available in german.

Hi all,

here you are:

"Kiel, the 10,10,2000

statement to the Milan II

Weeks and months it was quite calm almost around the Milan II. Last large appearance and associated, official messages took place on the Atari fair in June in Neuss.

Meanwhile many Milan fans are however in unrest guessed/advised, because they do not receive acknowledgements for the well-known erscheinungstermine of the Milan. Long time lasted it, until we could take position from the company Milan officially for current situation.
However the reason is that we did not want to publish wrong information, up to the day of yesterday (09.10.2000) no unique decision had
met.

The Milan II

The targets of the Milan system were clearly outlined: It had a new board Design on base of the Milan I ago, which continues proven items in addition, brings substantial improvements with itself. So e.g. a AGP port or also the support of SDRAMs.

In the spring this yearly was again revised when desired the selling partner, which always transmitted an estimation market chances of the Milan to the computer enterprise, the concept. In order to go to any dependencies on driver manufacturers for diagram cards and sound cards out of the way and besides the Milan II in a compact housing to under-get be able, became decided, to integrate the components for diagram and sound on the Motherboard.

A first prototype of the Milan 060 was to be seen on the fair in Neuss.

Against expecting technical problems in-crept again and again, for whose purpose even additional hardware designers were engaged.
The integration in particular the AGP port, in addition, the SDRAMs prepared hardware-technically under-waited difficulties, which could be solved however after viscous advancing in the late summer 2000.
Just in this moment occurred what had to occur:

The manufacturer one of the two important log IC chips of the Milan (he takes over the complete emulation of the not existing Atari hardware) was adjusted despite contrary promises on the part of the manufacturer and is available neither in smaller numbers of items than remainder nor in large numbers of items than special production.

A shock for the Milan team, because a scarce year work was in this chip. An adequate, counterpart existed at the market, which can be adapted fast, dezeit not or could not be found yet.

Together with the selling company AXRO the situation in the late summer 2000 was discussed. Together with our distribution and interlocutor it came to the result that a small computer company, which does not manufacture quantities in hundred-out one hundred and abverkauft this problem could flower on a long-term basis again and again. And first considerations for adjustment the project were discussed in addition, put fast again ad acta!

The new OS

In this moment a project was drawn from the developer drawer, which Uwe cutter, Ali Goukassian, Michael rockers and Thomas Goettsch had already prepared in November 1999 and had conceptionally held. It should be implemented actually only in one of the
future stages of hardware production, in order to save time.

The speech is from a new operating system concept, which almost hardware independent a Atari TOS or a MagiC Milan could make thereby.

The new Milan OS, which differs technically far from the Atari TOS, because many areas of programming were structured new, is simply expressed structured as follows:

It consists of a depending on hardware and an independent layer. This step had to be carried out, in order to bring Atari programs on the new Milan hardware to running.

While the independent layer takes up the instruction e.g. for the access to sound, diagram or fixed disk, this instruction is interpreted and
the depending on hardware layer, which transfers the actual access then transferred.

Thus it should be ensured that easy modifications in the hardware (Milan I - > Milan II) at few expenditure to be adapted can.

MagiC Milan again was changed so much opposite the standard designs the fact that it does not make any own access more on the Milan hardware but transfers its ï¿½Wuensche " to the hardware to the Milan TOS. This step made the MagiC Millan development again independent of the Milan hardware.

The new operating system concept designates now a step, which was already initiated in similar courses by Apple with the new MacOS X or by Amiga Inc. for the new Betriebssytem (project name Elate):

Depending on hardware sections of the operating system Milan TOS by our developers against a Linux core one exchanges at present. This part of the operating system is not under any circumstances Atari typsch, but serves excluding the interpretation of the hardware accesses on the part of the operating system or the software.

Linux, a Unix derivative, is Freeware and by hundred-from one hundred of programmers is as well known developed further.

And Linux is today so far established that drivers for the access to USB interfaces, fixed disks, are Firewire interfaces, network cards etc. always briefly after appearance of the respective hardware or hardware standard available.

For the Milan crew it had meant in the past to develop drivers e.g. at all for responding the Milan USB port.

Owing to the new concept the Linux core is embodied however with the independent part of the Milan TOS. Places the Milan TOS or the software, which runs under it, a request of an interface, this is transferred over a standardized interpreter to the Linux core, which is at the
edge mentioned also only a few KB large. This again already has all necessary drivers, which are world-wide freely available, in order to tie up any modern hardware (- standard) to the TOS.

Perspectives

The perspectives look today on the one hand well, on the other hand disappointing: The Milan II was put on ice. Months-long work, which swallowed thousands of D-mark is likewise triumphs, like the hope of many Atari users to be able to call a fast Milan II already soon their own. This is to be charged primarily to technical problems. In addition, beyond that the months-long is tried to also draw venture Capital
societies (holding companies) from Germany in the boat in order to supplement the capital clearly, failed. In this country ones become at present primarily InterNet air things, which do not create anything within shortest time from that a fictitious million-value, which falls mostly however evenly so fast again into the depths, supported and from the baptism elevated. One that really few enterprises, which has to offer computer know-how and its own, small and operating system equipped with much software, however unfortunately saves the large risk, costs for the investors by materials production (Main board etc..) to cause.

But this means the end of the project with nieces. Milan computer system will offer, to all that, which would like today a Milan further the
Milan I with 040er-Prozessor. And also the Upgrade card on the

060-Prozessor are to be had further and meanwhile. In fact at present thus nothing stands to the possession of a Milan with 060-Prozessor in the way.

The step, which is now done, is to be looked toward Milan III. And but at present two scenarios are to the selection, which build all together on the fact that the Milan TOS (and thus the essay MagiC Milan) already soon it is almost hardware independent could:

a.One decides for an Linux core adjustment on e.g. AMD hardware (Athlon, Duron) and standard board peripheral device. In the course its is selected a board, which imports only in this country be acquired must. Conditions are fulfilled like a large Flash EPROM. This can be still a TOS based computer, which starts directly from the chip. The arithmetic performance would grow with this solution proportionally to the assigned processor and with a 400MHz-Chip the performance of a 060-Prozessors very far would already exceed.
b.One begins (if necessary own) a PPC G3/G4-Board, which is still closer to the 68060-Prozessor, so that starting from 350 MHz more than one doubling of the arithmetic performance was achieved here.

So that the TOS runs also under these processors, a 68k-Interpreter is integrated, which runs differently than Windows or MacOS based emulation, independently natively and a high arithmetic performance enabled.

For version b) a license partner was opened at present, which would sell 2001 maximummodern G3-PPC-Boards toward start to manufacture and as OEM product at Milan. Here it would be ensured that the computer altogether approximately 1700, - DM would cost. The negotiations run at present. The partner would not like to be called before contract drawing. Clear it is however that specifications were likewise kept such as diagram and sound on a min in OTHER board, like now even the binding of a network adapter and a bus clock of 100MHz.

The perspectives, which would offer one from the NOT already promptly transferred to implementing, are enormous:

The entire operating system will be still smaller approximately 2 MT and could be operated on processors such as AMD, Intel, PPC in addition, RISC, Aplha and Thosiba at a comparatively small expenditure.

Thus the Milan TOS with MagiC Milan becomes in nu one of the smallest, portable operating systems, with which the software (differently
than e.g. with Windows CE) does not have again to be compiled, in order to run on different processors.

First versions of this new operating system symbiosis already had to be seen in October.

Result

Their confidence, dear customers, surely shrank in the course of the time, because you had to wait for a long time for an not appearing device. But a reproach, which one cannot make for Milan of computer system is that that in this house the things were not finished. Because as only manufacturers Milan of computer system succeeded in bringing an executable 040/060-Computer to the price eligible for financing in circulation. With this step Milan succeeded in proving that here uncoordinated technique Freaks at working is not only, but
that concepts and clear lines can be transferred also up to ready for the market ones.

Herein the enterprise differs from numerous companies, which let intelligent and talentierte headings operate senselessly for many years, without supplying results.

The Linux core idea, which trusted to transfer itself the team not promptly to be in order not to stop the Milan II according to schedule, seems the only load-carrying solution. It nevertheless gave always considers, whether could succeed, a 80MHz-Computer to intersperse and also whether it would be enough to use a main processor become outdated technologically hopelessly as the 68060.

These concerns are extinguished with an impact. The Milan could live on already soon on efficient platforms and let the operating system on competitive hardware, loved by us, continue.

In particular the perspective to receive G3/G4-Boards wakes nevertheless many hopes, because such a computer would not only underline the breath of the non-standard one - it would arouse world-wide much interest.

And this way seems also economical to be more lucrative, because nevertheless now no hardware production connected with high risks must be carried. The developers can itself on an area - the operating system - concentrate. And so it is only one question of the time, until
the new Milan III can be on our desks.

Realistic estimates to the consequence this ï¿½t until 2nd quarter 2001 the case could be. But as said: Then as super modern hardware.

And up to then there are the Milan I - 060 for all those, which would not like to do already today without speed.

We ask for your understanding for the fact that we decided us not to produce an outdated hardware standard in the long run but the expenditure on capital assets amounts to some million German Marks. And even if you, dear Atari fans and we know that 80MHz are

sufficient, in order Atari software with highest speed to operate - one will be able to put this not close to the mass of the computer people.

If one intersperses the Milan TOS (project name TOS 6) in the future however as ï¿½Easy Computing Environment " - thus a working environment for simple computers which can be served -, in which it runs on some platforms. Additionally now also still another its own reference hardware on base of a non-standard power PC system offers, then one has a real chance by the world public of the computer-interested users and media to be considered. We could learn that in the course of the passed months.

In the future we will inform you - there we now the route of march of the Milan know - again regularly about the events both in the InterNet
and about the publications.

Its Ali Goukassian and the Milan team "

Bob King.

hmmmm. methinks you do not underSTand!
:-)
When I partition a drive under HDutil
for TOS-DOS compatibility,
I am only allowed ONE partition!
Since TOS won't recognize more than 1GB,
I effectively have
to throw away 500MB! blecch.
otherwise 2 750 MB partitions work for
me also! :-)

> > figure, eh?)

There's more to go wrong in a PC,
once you count all the plug-in boards,
the tight system timing tolerances, and
the fact that the hard disk access is
more regular than with an Atari, hence
extra wear and tear.

> Well - I've had harddisk crashes with both my Falcon and my PC, so
> there's no difference...
> However, it really is amazing that Atari machines in general do tend to
> just work and work - maybe they were built with some quality thinking in
> spite of the low prices? :)

Well, it's really quite true that things aren't
made like they used to be. Nowadays, it's
not uncommon to see a Volvo with a punctured
bumper, simply because they now make them
out of thin colour-coded plastic to match the
rest of the body rather than for strength.
That was unthinkable on the tank-like models
of old. Even in the ST's history you can see
clear changes in quality. Where STM1 mouse
ball rollers where once made of brass
("Built like a brick Atari-mouse"), they
were replaced by plastic. Key-top markings
once made with proper two-shot injection
moulding, where replaced with transfers
that wore off (though the ones on Mega STE/TT
keyboards were of better quality than those
used for 520/1040 machines).

This trend in manufacturing also has a lot
to do with modern techniques of using
minimal materials, reducing waste emissions
and energy consumption. Economics and
market share have a lot to do with it as well.
Consumers are suckers for cheap prices
above all else.

In the old days, before advanced computer
simulation, things were often built with far
more material than strictly necessary, which
also usually resulted in extra durability.

> that since all programs - except for a lot of demos and some games -
> work with the VGA monitor.

VGA places more bandwidth demand on
the machine, slowing it somewhat (hence
games and demos tending to favour RGB)
but also offers far superior resolution,
more suited to serious work.

> The terrible sound of the ST? Hmmmm - did you consider therapy...? ;)
> The sound system has been altered somewhat, but the built-in sound can
> probably be compared to the STe - correct me if I'm wrong (never used it
> for anything but the click in CAF)...

Yes, the Falcon has the same Yamaha 3-voice
programmable sound generator in addition to
its 8-channel 16-bit digital audio.

> I'm not quite sure about that. Uwe Seimet is probably the man to ask.
> You can't use partitions larger than 1GB, but I never got 1GB to work
> completely stable with CAF when I tried - it had to stay somewhere
> around 700MB or so - otherwise CAF seemed to get confused (CAF only uses
> part of the harddisk driver - and has special routines for the harddisk
> handling...).

I've done countless CAF installations with
HD Driver 7.x and 9GB IBM SCSI drives
divided into 9 equal partitions with absolutely
no problems at all. In fact, I've never had any
problems with CAF, ever. Am I just a lucky one?

> The Atari emulators for PC can't make use of any midi applications, so
> that's a waste of money if you plan on using CAF.

Not to mention emulating the high resolution
MIDI timers would zap all those MHz.

> The PC emulator that was around for some time was a 286-emulator. Try to
> run Win98 on that one and you'll throw the computer out of your window
> within 5 minutes...

On a 286 emulator, Win98 probably wouldn't
even finish loading in 5 minutes! Certainly isn't
too fast to load on a real PC either.

For a given logical display dimension,
the smaller the CRT the higher the
actual resolution, and apparent
sharpness. This was not the reason
for the SM144's performance though,
it really was just a bad monitor with
poor focus.

> Couldn't the supposedly increased flicker be due to the increased distance
the

Flicker is to do with scan frequency, but
your perception of it may be increased by
a larger area or closer viewing distance.
Maybe even a faulty power supply.

I would rather suggest to socket these chips and replace the LS types by
faster ones with stronger output capacity (74F should be sufficient).

You may need to insert an additional 74F244 or similar into the signals
which are generated by PALs. Using 74FCT or similar, the additional delay
should not cause problems.

Message-ID: <YXnwD+DJ2645Ew$e@lovecraft.demon.co.uk>
Source record: 56370

Ah, such joy. Back onto the STE, now with added spagetti powering an HD in an external case, plus I fixed my external 1.44 floppy. Installed all the usual CPXs like NVDI etc.

Tigercub is working beautifully, but doesn't seem to be capable of uploading patches.

GenEdit, with /all/ the files in one directory, seems to work - but crashes rather frequently. Shame, since it has templates for the D50 synth :(

Electronic Cow software, interesting as it is, is no use to me since it won't run in less than 640 x 400 :(

So - my main question is: Why is GenEdit crashing, and does the commercial package MidiQuest work on a medium-res screen, and look half decent?

So much of the software has Falcon screendumps :/

My Link 1 has handled everything I've thrown at it so far, including CD-
ROMS and a scanner. The Link 1 can't handle parity, but most drives
don't care anymore or have a jumper available.

I suspect the Link 1 and 2 are rather similar overall, but I'm merely
guessing. I know that the Link 1 works quite well for most, if not
all, non-parity devices.

Actually, TOS 4.04 has several keyboards built in, so just a setting in
the NVRAM is enough to do the trick. One thing you may wish to verify
is that you have a US keyboard. I don't (a curse on Toad Computers,
circa 1997), and although I set the NVRAM correctly, the keys READ
incorrectly. Fortunately, I'm a touch typist (but my wife isn't!).

According to magicos.de and Milan itself, the Milan II is dead, a victim of a few nasty hardware bugs and the fact that one can't reliably get parts for a 1995 era motherboard anymore. If anyone cares to translate the German, I'd love to read the details.

I'm confused.

I read on the group TOS can handle a 1Gb Partition. Yet my STE with
ICDLink2 and TOS 2.06 enabled split an 80Mb drive into 33Mb Partitions
(I think, 2 x 33Mb, 1 x 14Mb, 1 x 5Mb).

I'm about to get a larger disc, so how can I make sure it is sensible
about it?

3931. Falcon SCSI question

Newsgroup: comp.sys.atari.st
Date: 2000-10-11 02:37:22 UTC
From: ryan daum <opiate@saturn5.com>
Message-ID: <39E3D46C.1DE0B42C@saturn5.com>
Source record: 56375

I recently purchased a 2 gig external SCSI unit (IBM DORS-32160),
manufacturered in 1992). I am able to detect and mount it correctly
using an Adaptec PCI SCSI card from both Windows and Linux. I am also
able to use Atari HDX and ICD Tools to format and partition the drive
from my Falcon. However, AHDI does not detect the drive.

In HDX, the drive appears as "SCSI 2 - DORS-32160". To ICDBOOT.PRG it
comes up as ID 10 IBM DORS-32160. However, AHDI.PRG does not detect
the drive, and even though I am able to partition the drive fine,
I never seem to be able to actually mount and access the partitions.
What am I doing wrong?

I don't particularily want to shell out money for HDDRIVER if it is not
going to fix the problem. Am I missing something obvious?

One thing that strikes me as weird is that I definetly have the drive
set to LUN 0, but it's coming up as SCSI 2 to HDX -- is this normal?

Can somebody please please help me here? My old 500 meg Quantum drive
is not fast enough to do real digital audio recording with on the
Falcon, it seems.

AFAIK 1Gb partitions are support only by TOS 4.0x but with 2.06 you
should be able to use 512Mb partitions, so maybe ICD is the problem.

> What am I doing wrong?

If your AHDI hasn't been patched, it won't recognise any SCSI units if
they aren't in order 0-1-2 etc. After the first missing ID, AHDI won't
search for the rest :(
A word of warning... ICD isn't fully AHDI compatible and due to this, a
large ICD partition won't work with Cubase Audio, if that's what you're
aiming at.

> I don't particularily want to shell out money for HDDRIVER if it is
not

Then that's one of your problems. SCSI ID and LUN are different things.
If you set the jumpers on the drive to ID 0 (well - that probably means
you'll have to remove one jumper), AHDI will probably recognise the
drive correctly. However, I'd suggest HDDriver because it's simply the
best driver around and it gets updated on a regular basis. HDDriver is
AHDI compatible (as opposed to ICD), so you don't risk any problems -
and it's faster than AHDI.

> Can somebody please please help me here? My old 500 meg Quantum drive

Please let me know if the drive works out ok with CAF. I don't have many
IBM:s in the "CAF-compatible drives"-list on my website...

Wow! What a question.

There isn't much today, really. If you could make it run SETI@home or RC64 or something like that, you'd probably get through a lot of blocks.

As of 10/12/2000
User Groups:
Erie PA Atari Group
TI Chips

Cleveland Classic Atari Group

Vendors:
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Fred Wagaman
Alan Hewston
Thomas Mclaren
Andy Frueh
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room- MAME, etc. We are hoping for some people with arcade systems to bring them.

See ya at the CCAG!

3940. Atari 1040ST help wanted...

Newsgroup: comp.sys.atari.st
Date: 2000-10-12 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <2rxF5.23$qj2.4963@news.goodnet.com>
Source record: 56199

I have the opportunity to buy a 1040ST for $5.50 (US dollars). It doesn't have a monitor or mouse. What I need to know is, are there mods available to make the 1040ST usable (in color modes) with an SVGA monitor, like my 15" Sony E100. As well, is there a way to reroute the wiring in a two-button PC serial mouse to make it work with the 1040ST?

I know that they say that the monitor has to be able to do 15Hz Horizontal in order to do color modes (the lowest mine goes is 30Hz), but is there any way to accelerate the horizontal signal from the 1040ST so that it can display color modes at 30Hz?

As well, I'm debating as to a system design challenge... attempt to build an ST that is 100% optimized (maximum RAM, maximum video output hardware, etc.) I want to see if we can't build a system that can do the Internet smoothly, based less on a fast CPU and mainly on an awesome video and motherboard subsystem. Of course, the OS (TOS/GEM) might get in the way of that, but... surely it must be possible if someone tries hard enough.

Milan II may be dead, but why not have fun reinventing the old 8MHz 68000 ST's into a maximized system for the loyal masses! Hmm?

That should be sufficient, so I guess you should check if the connections to
the SIMM are all OK (and if the DRAMs on the SIMM are connected in the
necessary way for an ST).

What is "large"?

TOS 4 only supports partitions below 1024KB, regardless of the disk driver used. On larger partitions, Gemdos will definitely misbehave and probably ruin your data - on the Milan TOS, I am sure that Fseek breaks on larger partitions, on the falcon TOS 4.04 other Gemdos functions might be broken, too.

Basically I did it like this (http://atari.nvg.org/stacyram/), except
that I didn't remove the original RAM. Perhaps this is the problem?
Since I "tap into" the address-lines between the resistors and the
original RAM it could be that the load on the address-lines is too
high. I'll try to cut the address-lines between the resistors and the
original RAM tonight and see what happens.

Back in the good ol' days (i.e. when I got my first harddrive and was
ecstatic about the incredible speed and size of a LPS105...) ICD's
driver used a special format for partitions bigger than 32Mb.

That should not be the problem - I installed several ST RAM expansions that
way, even with the old ones (with 1MBit-DRAMs) this was usually no problem.
Now with the minimal load that a modern 4MB SIMM produces, you should have
ample margins.

You're right, I just tried it but it didn't make a difference. Perhaps
I've damaged the SIMM :-(

> to go about setting it up.

If you can run SLIP or PPP over that port on the Mac (you should), you can
run STiNG or MiNT-Net on the TT and use a "normal" TCP/IP connection
instead of AppleTalk. An ordinary Mac printer-cable can be used as a
null-modem cable between the Mac and TT.

If you mean 32-bit SIMM 72-pin SIMM, then it should work. Done it many times.
When debugging, it usually helps to disable upper two megs and try with one bank
only.
Recheck wiring on all address lines on SIMM, then check RAS&CAS wirings.
I did manage to mix-up RAS/CAS line between banks. BTW, have you properly
disconnected old RAS/CAS lines and tied them to Vcc ?
One more thing, connect GND with more than one wire to SIMM.

I actually had problems with CAF and partitions over about 700MB, when they started to fill up. Otherwise there hasn't been any problems and if not used for CAF, partitions up to 1GB worked fine.

Most WD 1772-2 chips are fine at 16MHz, jo , you could try ripping one out of a defunct STFM etc (ACRONYM CITY) and replacing it. My STFM run's OK with one of these. TOS 2,3,and 4 default to 6ms, only TOS 1 uses 3ms. Replacing the floppy chip on the MegaSTE and TT is pretty simple, just lift the hard drive cover. Incedently I have had 2 MegaSTE's and both of them had bent pin's in the WD's socket, pretty weird quality control, eh.

Hello All:

Just got some great PD from Derek Johnson of Atari Notes (SOS magizine)

They are Gareth Jones' excellent Atari-Midi PD applications: Now
available on the File Section of Atari-Midi Egrps in the Gareth Jones
Folder:

>http://www.egroups.com/files/atari-midi/Gareth+Jones+Programs

Midimous.zip
Midi Mouse Music: Alternate Controller. Very Cool. Like Music Mouse or
Midi Joy with some twists. 20k

Pic_mus.zip
Picture Music. Create Midi music from Pictures
100k

Psycho_f.zip
Psycho-Fractal . Creates midi music from Fractal Images.Some very nice
NEO format mandalbrot images included. 355k

Psycho_m.zip
Psycho-Midi. Another Image and Midi program! 87k

Schoenbg.zip
Schoenberg PD version. Creates 12 row Serial Music! very cool

Actually I was after Derek for a long time on this one, and he finally
got it to me! Thanks Derek!

Please check these apps out. Would like some feedback.

Tim

While MOST do some just don't properly I don't know what Atari (Western
Digital) did, but with just about every upgrade to HDD I have seen, they
simply say if it dosent work try another chip. A bit like the STE DMA
debacle, some do most dont:-)

Bugger! Still if it is dicey, just put a socket in it. I have spare WD's, if
you need one just yell, I'll never use them. Both my Falcon's and my MegaSTE
have Ajax chip's.

Mhmm, my first harddisk was an LPS105 as well, with an ICD controller.
But it didn't use any special "format" for partitions > 32 MB (what kind
of difference should there be, anyway, if GEMDOS is to access it?), but
a special format for having more than 4 partitions on the HD (ICD stored
12 partitions in the rootsector, whereas AHDI stored only 4).

The only real problem I encountered was that Rwabs() of the ICD driver
didn't properly support the AHDI extensions to read physical sectors, in
that the call sometimes failed with no apparent reason. This might be
what causes problems in CAF, and it's the reason why you have to install
an AHDI compatible driver before using ICD2AHDI if you want to convert
your ICD partition table into an AHDI one.

Ciao

Thomas

> handle this size of partitions with ease.

Not to forget its support for VFAT (long filenames) and FAT32 (allows
partition sizes up to some Terabyte, although I wouldn't recommend more
than, say, 8 Gigabyte, as it gets awfully slow then, due to the
enormously large FAT).

Ciao

Ahh, that was it. Sorry, my mistake. I haven't seen an ICD adapter in
seven years...

As far as I am aware, it is possible to use a conventional serial mouse with an ST, so long as you have the requisite software. As for hooking it up to your monitor, there is no way u can connect it directly to a VGA monitor that I know of, but if u have a TV card in your PC, you could construct a lead to go from the monitor out on the ST and connecting the composite video out to the video in on the TV card. As for sound, just route that from the monitor port to the sound input on your PC - voila, instant ST on PC monitor.

I Have one of these drives on my Falcon and it works fine. You need to disable the Unit Attention function of recent IBM drives for most software (apart from recent versions of HD-Driver which of course supports it). From memory it is probably Jumper 5. I can't remember if there is an Auto-Start function. If you have Web Access then try getting the info on jumpers from :

http://www.pc-disk.de/pcdisk/index.htm

most drives are there, or direct from IBM.com, they support all their old drives...

I first ran across the Unit Attention thing when I installed an IBM DPES31080 on my STe....

I use HD-Driver, having been a longtime user of CBHD (which also worked well with this drive)...HD-Driver rocks, buy it now.....

I actually just spotted one last weekend at a booth in the Dufferin
Mall (Toronto) - blue, with a white original Atari logo.

interestingly, it also had in small letters on it (c) 2000 Atari.
Looks like Hasbro is licensing the name out - they're not dumb!

You can't make it work other than in monochrome mode on an SVGA, since the frequency's wrong. With an old Multisync going down to 15kHz - or an old Amiga monitor, it would have worked. A SCART cable to your TV could also be an option...
There is possibility to connect a PC mouse to the serial port, using a program to make the adaption - but some programs don't accept that solution, so they won't work. Mario Becroft's mouse interface works perfectly and is always compatible since the PC mouse plugs into the original mouse port via the interface.

Hello There
For some time I have had startup problems on my Falcon 030. When I switch it on
the Harddisk and the rest of the machine doesn't start. If I press the reset button for
5-10 seconds the machine normaly starts, but some time I have to switch the Falcon and
press the reset button a lot of time to get the machine to life.
What's wrong ???

I have had the machine for 6 years now, but it is only the last year this problem has appear.

Thank, Preben Sloth

I'm still drawing up plans of an STe accelerator. Based on a 32MHz
68000 processor, 32Mhz FPU ,8mb of 322mhz RAM and IDE@32mhz. Oh
yeah, also a Matrix graphics card (not sure what speed possible yet,
still waiting for it in the post). This will be for personal
use only (not commercial as I can't see it being totally "bug" free).
Mainly for CAD PCB use.

I would love to use a 030 or better processor (not clever enough to
work that out) but by then you've almost made yourself a whole
motherboard. When I'm older and wiser, I'll design my own motherboard
as college/uni project!

>Milan II may be dead, but why not have fun reinventing the old 8MHz 68000
>ST's into a maximized system for the loyal masses! Hmm?

Try getting hold of a lots of fast 68000s then, you'll find it
difficult. A new motherboard will be better, than bodging an ST with
an accelerator. I don't have the knowledge or tools to make
motherboards.

Get someone to program the OS for the Phenix motherboard as it is
truely awesome (and wasted at the moment). Read the great article in
AC 15 by Shiuming Lai. Dual processor, 2xDSPs, USB...etc..etc

Which is why I was saying, is there a way of *accelerating* the signal (frequency) from the ST video out so that it CAN do color on an SVGA monitor. Sort of like translatingt the signal so that the ST is still outputting 15Hz, but the monitor is getting 30Hz. Or maybe it can be done the other way around... or something.

You wanna have fun? Let's work together to create the Neotari computer! If you listen carefully, you can hear the implication in the name. :-)

Let's hack and improve TOS/GEM (yet again) to make it work (either with a 68040/060 or PowerPC chip), get the required permissions (rights) and sell the dumb things! If programmers and hardware people get together on this, we could essentially recreate the Atari computer and keep everything modern!

Um, but don't let my enthusiasm stop you from believing it's not possible or not worth trying... my enthusiasm was muted here once before by more than one person. Of course, I was trying to get Atari back as a company then, which, so far as I can tell *IS* impossible (Hasbro has their own plans for the name amd property rights)

Hi all you Newsie Gurus,

Why does the numbered order of the messages, eg the last one I have from Steve Sweet Re: Menu controller number 183105, not agree with date order, eg that message is dated 12 Oct 14, whereas message No 183103 is dated 13 Oct 75.
I would like to list them in date order, can I?

Bob King

>You wanna have fun? Let's work together to create the Neotari computer!
If
>you listen carefully, you can hear the implication in the name. :-)

Count me in. ;-) Unofrtunately, I've never been able to purchase an ST,
though I'm still on the lookout for one. 603e PPCs are $44 when purchased
singly, which is still cheap enough to consider. What kind of expansion
options does the ST have?

Thanks,
John

3994. Index to Atari-Midi File Section on Egrps

Newsgroup: comp.sys.atari.st

hello All:

I decided to list what we have collected now on the Atari-midi file section. You will find quite a few programs that are NOT on any FTP servers like Umich. I would like any comments you have on these apps.

There are also some Utilities that are usefull as well.

Tim

INDEX To ATARI-MIDI FILE SECTION on Egrps. As of 10-13-00

http://www.egroups.com/files/atari-midi/

4oped.zip
An editor for most 4 Operator Yamaha FM synths. 53k
525.zip
samplrate-converter, shareware 65k

Archifon.zip
A Microtonal program from Norway. Extensive Help but all in dutch (I believe)Allows you to play songs in microtonal scales. Very Intriging. 196k

www.myatari.com has them, as does Best. Personally, however, I'd
consider getting Mario Becroft's mouse adapter and trying the PC realm.

Another option is to get Mario Becroft's serial mouse adapter. This way you
could just use most any PC mouse.

Hi all,

the title says it all.
has any one in the UK got a copy of this book, complete with CD etc for sale. I sent off to Amazon and got the next eddition 'Electronica Dance Music ....', full of PC etc stuff, hardly any reference to Cubase. I want the 1997 edition, Cubase only. It's out of print, isn't it bloody marvellous how the s*****g PC takes over the world even in areas where its not up to the Falcon.

4000. Re: Atari 1040ST help wanted...

Newsgroup: comp.sys.atari.st
Date: 2000-10-13 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <kTNF5.104$qj2.13974@news.goodnet.com>
Source record: 56232

I just thought of something, but I need someone with technical know-how to confirm if it's possible...

The 1040ST monitor out has a Composite Video pin as well as R G and B (plus syncs of H and V), etc. My brother seems to think that you could easily connect the Atari ST to a A/V-capable TV (you know, the TV's that sport the Yellow (Video), Red and White (left and right audio) RCA plugs) by just using the Composite Video pin, plus Ground.

Is it that simple? If so, how good (or bad) does low res look on a TV?

Is there an way to simply "hardwire" (tying the pins together) a series of pins together on the port to get different kinds of video output? If so, what kinds of video output is possible with the 1040ST?

I'm hoping for a reply before 4pm tomorrow (Saturday), so I can decide whether or not I should get the 1040ST.

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

4002. Wanted: Mega ST 4! Pay upto $100! Buy or Trade!

Newsgroup: comp.sys.atari.st
Date: 2000-10-13 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <8s8e8r$8ac$1@user2.teleport.com>

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

4004. Re: Atari 1040ST help wanted...

Newsgroup: comp.sys.atari.st
Date: 2000-10-13 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <KpQF5.109$qj2.16325@news.goodnet.com>
Source record: 56236

At that price ($44 for a 603e PPC chip? Wow!), I don't see why some enterprising young developer hasn't decided to go for it! Might not blow the doors off a PIII/1GHz, but it'd be a blazin' lot faster than todays ST clones!

I say we try it! Christen the company "Neotari Corp.", Christen the computer "Phoenix I", get permission to use the original Atari case designs and/or make a few changes to the Mega ST case design and avoid Hasbro altogether), throw in some nice high-end specs (all onboard to minimize driver developer troubles and allow maximum optimizing of hardware usage), write (or port) an Atari ST emulator, and see the hoards flood forth and the money roll in!

Of course, I tried suggesting this once before to the distain of nearly everyone on the newsgroup, so I don't expect much support from others on this idea, but... I say it would work!

4005. Atari ST video help wanted!!!

Newsgroup: comp.sys.atari.st
Date: 2000-10-13 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <VgTF5.124$qj2.18652@news.goodnet.com>
Source record: 56237

I need to know how to connect my 1040ST to an A/V-capable TV (you know, the ones with the Yellow, Red and White RCA jacks?), if at all possible. Are there other video modes (S-video, RGB, composite, etc.) possible by tying certain pins together on the monitor port?

Any and all help, greatly appreciated.

Jared

Even the Bobby site uses tables for formatting! You're OK as long as you keep the tables simple so the page degrades usably, and don't misuse TH tags for text formatting, IIRC. Our work site uses tables and passes the Bobby tests OK.

I'm finally in need of another Atari ST mouse. Mine's getting hard to move around. When I clean the ball I noticed the metal on the wheels was a little corroded -- I figure this can't help. Cleaning the mouse doesn't do much good at all & have tried it with several mouse pads to no avail. Has a real hard time moving up. I'm giving up & am ready to buy a new one. Anyone know of any good web dealers or 800 numbers I could call to order a replacement?
Thanks for any help,
JJH

Yep, you can also use ext2fs (Linux) and MinixFS (Unix filesystem)
AFAIK there exist a driver (read only) for the (old) Amiga FS too.

True, but try getting the PPC to work on ST software without having
quite a few problems will take hard work. I would imagine TOS would
have to have an interpreting core to change old code to new code
for the differnet PPC instruction set.

>I say we try it!

Who's we? Writing software from differnet corners of the earth is OK,
as you can send each other parts of the code to see what others think,
but hardware, well, that's almost impossible. If one person works on
the video subsystem and another 1000 miles away works on the CPU/DSP
side you need good communication skills. And the best way of doing
that is to see the person and go back to the good old days of talking!

>Christen the company "Neotari Corp."
Nice idea.

>Christen the computer "Phoenix I",
Why? There's already a computer called that. (TOS clone)

>Get permission to use the original Atari case designs and/or make a
>few changes to the Mega ST case design.
Forget that old case. Custom cases cost big money (200+ UKP). Use a
ATX form factor and have sleep mode in TOS. :-)

>Throw in some nice high-end specs (all onboard to minimize driver
>developer troubles and allow maximum optimizing of hardware usage
If you ask me that was one of the STs let down. I prefer the
expansion ports. It may take time to get it down, but it's easier to
upgrade. VME slots that confirm to the proper specs?

>write (or port) an Atari ST emulator, and see the hoards flood forth
>and the money roll in!
Why port an ST emulator? What OS were you thinking of it to run in
native mode? Windoze!

I say either the fastest PPC or G3 chip with some type of expansion
sockets, running KEMD (or whatever mint) Linux (PPC version) Magic and
TOS, possibly all at the same time? Lots of DSPs for smooth audio and
video. Real decent graphics chip set with multiple screen output.

Market it at the professinals, not at the average home user.
That's my views

Dance music? Isn't that like just, "Boom, boom, boom, boom..."
More ridiculous bass and ear-splitting treble the better :-)

> full of PC etc stuff, hardly any reference to Cubase. I want the 1997
edition,
> Cubase only. It's out of print, isn't it bloody marvellous how the s*****g
PC
> takes over the world even in areas where its not up to the Falcon.

Well, the PC has a lot of "Instant music" type
programs, many of them geared to dance music.
The books you refer to may be no more than
"Idiot's guide to..." things which explain what
the manuals didn't (or to make easy money
out of foolish consumers, depending how you
look at it).

You might find a better way to learn programming
techniques is to find pre-made MIDI files of that
sort, and dissect them in your sequencer.

The yellow RCA jack is composite.
Pin 2 on your ST's 13-pin DIN monitor ouput.
Pin 13 is GND.

RGB will give you better quality.

I have a TT / ST 2mb ram card for sale, it cost me £150 a while back, yours for £110 ono.

I also have a GEsoft 32mb TT fast ram card, un pop. It takes up to 8 x 4mb 30 pin simms. No idea what it would cost so offers around £80.

Barrie.

> move around. When I clean the ball I noticed the metal on the wheels
was.....

Keychange Music (in the UK) have a selection of new and used replacement Atari mice or used standard mice, all priced at £15 plus post. We also have trackballs at £28 plus post and Mega STE and TT keyboards, some in non UK languages, inc adaptor for STs and STEs, £25 plus post. (all show the language of the TOS, just the keys are non UK).

You can fix your mouse and mouse port at one go.

Barrie.

Its that simple, ready made cables are available for this.
You'l get ST-low amd ST-Mid resolutions.

So all I need to do is combine pins 2 (composite video) and 13 (Ground), like my brother said? Wow! It's that simple? The only questions remaining are...

1) When I'm looking at the back of the 1040ST (facing the video port), which side is pin 1? The left or right? Sometimes schematics are drawn from the inside facing out, rather than the outside facing in. Just don't want to get the wrong pins...

2) Is the video quality any good? I assume it would be fairly clean (easy to look at, centered, no blurriness, flicker, rolling, wavy lines, or whatever), like on most video game systems (i.e. the from Sega, Sony, Nintendo, etc.), except I don't know if their A/V yellow is higher resolution or somehow better than the ST's... is it?

>Atari?

With the Thing desktop (shareware) you have the option to position new windows interactively - but subsequent opening of subdirectories uses the *same* window, so the old contents disappears as you describe. But if you hold down Alternate while double-clicking on the folder then a new window will be opened. I believe the same applies to the TOS desktop as well.

With jinnee, however, you have the option of hierarchical folder structures that allows opening several levels of subdirectories while the other higher level directories remain on screen. To quote from the HYP for the old 1.12 version:

2.2.3 Hierarchical folder display

In text mode this feature, borrowed from the Mac Finder, displays small triangles (or other user-definable icons) to the left of each folder. These can be used to navigate sub-directories. Click on any right facing triangle to display that folder's contents and the triangle icon points downwards instead. A click on any downwards facing folder hides its contents again. jinnee makes it easier than ever before to move/copy files between nested folders!

The new version (2.5) should be available from SySol RSN (I hope!).

Regards, /Peter/

>are properly marked.

You don't say where you are, but I would guess in the USA and that the
problematic Falcon is fitted with a US keyboard but using an English
or other European TOS (or perhaps came from a French-speaking
Canadian). In the UK (and also most of Europe, I think) Shift-2 is "
and Shift-' is @.

>The ~ key backspaces even though the Backspace next to it does the same
>thing

Now that is *not* usual - perhaps a broken trace? Or maybe you or your
program are confused:-) On English keyboards this key (between =/+ and
Backspace) unshifted is an accent-grave (ASCII 096), which looks like a
back-leaning single-quote (`), and shifted its a macron or overscore (¯)
(ASCII 255) (though many programs, including Everest for instance,
convert the overscore character to an underscore). German keyboards have
a hash (#) unshifted and the accent circumflex (^) - as used as shortcut
for Control shifted on that key.

> and my backslash key (when shifted) produces a tilde. The
>unshifted backslash key produces a ♯ sign

That's normal on European keyboards - the key below Delete is a hash (♯)
unshifted and a tilde (~) shifted.

>and when I shift the 3 key, I get a message 'Unknown command ^ backslash'
from my terminal program

On English keyboards Shift-3 is the UK-pound sign (£) but the German has
a paragraph symbol (like two entwined S's) there and no doubt other
languages have their own specifics as well.

>so the key obviously is producing a control-backslash keystroke rather than
>a regular backslash keystroke.

I doubt that, though your terminal program may be interpreting it as
such.

>So far I have no backslash nor pipe command key even though they are
>clearly marked, they produce the above marks.

On UK etc keyboards backslash and pipe characters are on an extra key to the left of Z in the bottom row, where US keyboards have a double-width Shift-key.

On a Falcon, you can easily change the keyboard language by using the 'Configure NVRAM' CPX. Just choose 'American' in the 'Keyboard:' popup that appears when you click on 'KEYBOARD' at bottom right of the CPX panel.

> I only noticed the
>assignment problems when going online and using the cli as I don't use
>thesde keys normally in my daily Falcon use. The other Falcon has normal
>key assignment.

Try using these problematic keys in a text editor. If they produce the same result then it is a 'nationality' probem. If not, then perhaps your comms program is set up for a US keyboard on one machine and a UK/European one on the other.

[Note that my quoted characters may get transformed by the mailer software when changing to an ISO characterset]]

>listing and I must constantly scroll down to the folder I was working on
>to re-enter it.

I think you can only choose between the various sort orders and so if
you create a new folder and sort 'By Date' or 'Unsorted' then that
folder will be at the top, or if your desktop allows 'Backwards' sorting
too, at the bottom. AFAIK, all the folders are *always* shown before any
files. The jinnee desktop allows hirarchical folder display where you
can have several levels of folders and files open in one window, and
climb 'back up the tree' again.

That is correct. I even offered to help work on the DCC send
bug. If anyone recalls an older version of aIRC that
mostly worked with IFusion failed with DCC connections.
Somewhere along the line a double check for a correctly
installed STiK compatible stack caused even more problems.
This is what I traced it to and reported.
Since only IFusion suffers from this and my mail goes
unanswered I am not motivated to work around IFusions
differences, and even if I do DCC don't work. I think it
makes more sense to tweak IFusion where the API differences
actually are. That is the current state of things for
those that are curious. ;-)

4035. Neotari Corp. brings us the Phoenix!!!

Newsgroup: comp.sys.atari.st
Date: 2000-10-14 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <l7bG5.180$qj2.28686@news.goodnet.com>
Source record: 56275

The Neotari Phoenix computer is a GEM2000-based computer with the following features:

1) PowerPC 603e CPU
2) GEM rewritten for PowerPC and upgraded
3) Internal IDE port (no floppy port)
4) LS-120 drive (doubles as 1.44Mb floppy, if necessary)
5) Two DIMM slots
6) 2x AGP slot
7) Three or four PCI slots
8) Audio card (vender yet to be established)
9) Video card (vender yet to be established)

All PCI/AGP cards installed will be soldered in place to insure permanancy and security. Tampering voids warrantee.

The exact same hardware will be installed in every system to insure consistancy.

GEM will be ported to the PowerPC chip and upgraded to be Y2K-compliant as well as improved overall, thus rendering it to be called GEM2000!

An Atari ST emulator will be written for GEM2000 and included with every system. This will allow Atari ST programmers to rewrite their software for GEM2000.

In the end, the Atari era can be reborn with no more concern trying to upgrade old Atari systems to the modern era, which is nigh pointless. It's time to accept the loss of Atari and all it's systems (clones included) and begin anew, while maintaining the essence of the Atari spirit in Neotari Corp. and the Phoenix I computer, using a revised GEM.

Any Atari programmers, developers, ST users, interested in this vision? Instead of trying to force ST GEM/TOS to work on ST clones, thus merely pushing a dead horse a few more feet down the road. Let's take GEM, rewrite it for the PowerPC processor (isn't GEM written in C? Mighty portable code from what I hear), and start a new computer system, made by a new computer company. Atari ST users can enjoy running their old software via emulation, and ST programmers can rewrite their ST softwares to work with the new GEM.

In the end, you have the same look and feel of GEM as the Atari ST's had, the same software (if not also new software and games!). The only difference is that it's not an Atari ST or Atari clone and isn't trying to push an outdated OS and technology where it can't go. Drop the old baggage and let's start fresh!

I'd love to see this realized and I think a lot of other people would too. A dream is the spark. Let's add some kindling and get this dream off to a roaring, flaming start! Hmm?

"Think not that anything is impossible or it will be. What is mere thought can be true reality. What is true reality can be used."

Jared (listening to the MIDI version of the Klax soundtrack... very inspiring!)

Source record: 56276

Ok, I'm so confused, it's not even funny, but...

Assuming this 1040STf (or fm, I dunno. All I know is that the 1040ST label on the top says 1040STF <-- the F is small, but uppercase. The label on the bottom says likewise) does NOT have an RF modulator (the only port I see is the monitor port, no RF port (which you oft would connect a channel switchbox to and attach to your TV), like on old game systems and such), does the monitor port have composite video on pin 2 (as I've seen and heard from numerous people)? If not, what does pin 2 do in these non-composite ST systems?

I just need to know if the composite signal is on that pin 2, regardless if it takes superhuman magic, prying with a crowbar, and the Jaws of Life to get at that pin. If I stick a wire in Pin 2 (actually its a hole on the ST's end, the "pins" are on the monitor cable, but you know what I mean) and I stick a wire in hole 13 (Ground), will I get a composite signal suitable for use on an A/V TV on that yellow RCA Video jack?

I just want to know if the composite signal is there, regardless of model, or if pin 2 serves some other purpose (or is just NC (Not Connected) in those non-composite ST's.

I guess that MagiC 6.01 doesn't support FAT32 then, as I cannot gain access to
partitions over 1GB on my Falcon no matter how often I type "FAT32" into
HDDriver's partition type field?

: produced against all expectations.

This sounds strange to me. What is this chip? If it is a custom chip then it is entirely up to the Milan people as to whether they want to or have the ability to get it fabricated.

Perhaps it is a standard programmable logic device, in which case I don't see the problem. If the particular device they are using is unavailable, it should be fairly easy to move the design over to another device. I seem to remember noticing that they used Lattice chips on the Milan 1. Lattice is still around.

It seems to me more likely that this is an excuse for some bigger problems (and it is not hard to imagine what those problems might be).

>serial mouse to make it work with the 1040ST?

Any route to output colour on a standard SVGA monitor is pointless. It can
however be linked up to your telly, and the SVGA monitor may be used for the
monochrome mode.
A serial PC mouse wil lwork either through the serial port with additional
drivers or through an interface to the usual mouse port.

>I know that they say that the monitor has to be able to do 15Hz Horizontal
>in order to do color modes (the lowest mine goes is 30Hz), but is there any
>way to accelerate the horizontal signal from the 1040ST so that it can
>display color modes at 30Hz?

There is, but it's not worth the bother. It's cheaper and simpler just to buy
a multisync monitor such as the NEC Multisync 2 or 3D, or a Commodore
1950/1960/1940/1942.

>As well, I'm debating as to a system design challenge... attempt to build an

>surely it must be possible if someone tries hard enough.

For speedy browsing, a fast CPU for the decoding of images is required as well
as good video, but once you have some fairly advanced video, the processor is
what counts, as well as some buses.

>Milan II may be dead, but why not have fun reinventing the old 8MHz 68000
>ST's into a maximized system for the loyal masses! Hmm?

Why? The Milan I isn't dead, and far more useful than a reinvented 8MHz
system.

Hi,

This is getting old news by now, but AtarICQ 0.145 is out and is a
rather massive update compared to the old 0.144 and is well worth a look
if you found the old release awkward to use. It also for the first time
has an overlay for native MiNTnet support. This OVL is logging and
should be considered beta as of yet.

If you download AtarICQ, be sure to grab the latest binary (145r2.zip)
since contains some small fixes. You will still need the full package
though.

OTOH, MiNT also provides support for some more dynamic filesystems than FAT32,
right?

To make the serial mouse work you need an adapter. It's possible to find instructions on making your own, but Mario Becroft sells premade ones that are quite good.

To make the SVGA monitor work, you'll need a RGB-->VGA converter and a custom cable. Look for the stand alone devices that advertise "watch any video source on your computer's monitor" and you'll do fine. Note that the VGA-->RGB are much more common and (of course) do you no good.

Try searching the web under "scan doubler" or "TV to VGA". One link I found is http://www.hallresearch.com/hall/converters.htm , but there's no pricing data. Expect to pay $100 - $200.

Source record: 56147

>1) PowerPC 603e CPU

Dude, it's possible that by the time we could get organized on this, the 603 could be unavailbable, or for opposite luck, that a g3 woulc be cheap enough to consider.

>2) GEM rewritten for PowerPC and upgraded

Unfortunately, we don't own the rights to GEM, and we certainly couldn't buy them. Why not make the machine so that it can run current software, which would give us time to write a new clone version?

>3) Internal IDE port (no floppy port)

This makes sense, but put a floppy in for christ's sake. At least the port. It's a simple enough circuit.

>4) LS-120 drive (doubles as 1.44Mb floppy, if necessary)

No idea how simple or complex this is, but I thought that you needed a NDA to learn the jucier aspects. Besides, Zip is the winner, ls120 is defunct.

>5) Two DIMM slots

If this is a hobbyists computer, why lock them into the bleeding edge? Better yet, why can't we put a riser card on a slot edge, and you can either load it with a DIMM board, or a 72pin SIMM ? Hell, it would leave that as an open option.

>6) 2x AGP slot

AGP is impossible to do for a hobbyist. I wouldn't know where to begin.

>7) Three or four PCI slots

>8) Audio card (vender yet to be established)

With PCI, it's a matter of writing drivers.

>9) Video card (vender yet to be established)

WIth PCI, it's a matter of writing drivers.

>All PCI/AGP cards installed will be soldered in place to insure permanancy
>and security. Tampering voids warrantee.

This is dumb. A "no user servicable parts inside" box designed by hardware hackers?

>The exact same hardware will be installed in every system to insure
>consistancy.

>GEM will be ported to the PowerPC chip and upgraded to be Y2K-compliant as
>well as improved overall, thus rendering it to be called GEM2000!

We can't port without source code and license. Since when has y2k compliance
been an issue for anything, anywhere? Not once, anywhere in the world, did
even some stupid mainframe crash. Besides, is the Neotari supposed to be a
banking computer?

>An Atari ST emulator will be written for GEM2000 and included with every
>system. This will allow Atari ST programmers to rewrite their software for
>GEM2000.

If we go to the trouble of writing emulation code, this isn't how you'd do
it.

>difference is that it's not an Atari ST or Atari clone and isn't trying to
>push an outdated OS and technology where it can't go. Drop the old baggage
>and let's start fresh!

Dude, you can't start fresh, and have any continuity. That's the mistake
Amiga makes. They want to call it an amiga, but have ZERO in common with
everything that amiga ever was. It's computer-culture rape, and mostly just
for corporate profit. The idea is that you keep enough of what the ST was,
but patch up all the weak points. It won't ever be an ideal computer that
way, but what is? If it isn't a hardware clone, and it can't run any atari
software (emulation doesn't count), then how is it anything like the atari?
Besides, I don't know anything about business, but I know this is a losing
proposition just by looking at it. Ever wonder why atari abandoned it in the
first place?

>I'd love to see this realized and I think a lot of other people would too.

> This is what I traced it to and reported.
> Since only IFusion suffers from this and my mail goes
> unanswered

I spoke to Ronald (Andersson) about this some weeks back and mentioned
this problem too.
Just to see if it worked with MagiC PC I downloaded the new version and
it totally froze the system - right away on program load (same with
earlier versions too). As a test I downloaded the Frac client and that
(apart from one option page)loaded ok - however not tried it online as
yet. From what I can tell AtarIRC is crashing even with STinG (rather
than IConnect) and MagiC PC, so something is causing a problem on
inialisation somewhere.

BTW I am only using MAgiC PC as my Atari is not working atm, so it's
the only chance I have to use my Atari software!

Regards
Sean

What is the use of ports when you solder cards into it? Will this in any way
improve security (if a crd breaks, how will you replace it?)? Even Atari
didn't do such a stupid thing.

>The exact same hardware will be installed in every system to insure
>consistancy.

Bland, bland, bland.

>GEM will be ported to the PowerPC chip and upgraded to be Y2K-compliant as
>well as improved overall, thus rendering it to be called GEM2000!

Looks like a good idea, but will we have binary compatibility with older TOS
versions?

>An Atari ST emulator will be written for GEM2000 and included with every
>system. This will allow Atari ST programmers to rewrite their software for
>GEM2000.

Rewrite their software? Won't it even be API compatible?

>In the end, the Atari era can be reborn with no more concern trying to
>upgrade old Atari systems to the modern era, which is nigh pointless. It's
>time to accept the loss of Atari and all it's systems (clones included) and
>begin anew, while maintaining the essence of the Atari spirit in Neotari
>Corp. and the Phoenix I computer, using a revised GEM.

Please choose another name, we already have a Fenix and a Phenix in the Atari world, we don't need any more confusion.
Oh, and I'll believe it when I see it, no earlier.

>Any Atari programmers, developers, ST users, interested in this vision?
>Instead of trying to force ST GEM/TOS to work on ST clones, thus merely
>pushing a dead horse a few more feet down the road. Let's take GEM, rewrite
>it for the PowerPC processor (isn't GEM written in C? Mighty portable code
>from what I hear), and start a new computer system, made by a new computer
>company. Atari ST users can enjoy running their old software via emulation,
>and ST programmers can rewrite their ST softwares to work with the new GEM.

And reqriting GEM for the PowerPC won't involve any "force" at all?

>In the end, you have the same look and feel of GEM as the Atari ST's had,
>the same software (if not also new software and games!). The only
>difference is that it's not an Atari ST or Atari clone and isn't trying to
>push an outdated OS and technology where it can't go. Drop the old baggage
>and let's start fresh!

If the OS is outdated, why port it?

>I'd love to see this realized and I think a lot of other people would too.
>A dream is the spark. Let's add some kindling and get this dream off to a
>roaring, flaming start! Hmm?

Outlook user. Just what I thought. Put your money where you have your mouth.

4058. Help: Need video pinout on Atari 1040 ST

Newsgroup: comp.sys.atari.st
Date: 2000-10-15 00:00:00 UTC
From: "O. Alan Jones" <oajones@bright.net>
Message-ID: <o%jG5.805$o3.59761@cletus.bright.net>
Source record: 56151

I just picked up a Atari 1040 ST, but I don't have a monitor for it. Can someone please direct me to a schematic on the 1040 ST so I can find out the video port signals so I can hook it up to one of my monitors for testing.

Thanks in advance....
-Alan

Yep, Lattice PLDs were used on the Phenix design as well. I heard it
was the CPU (68060) that was difficult to get brand new and that they
would need to change over to the Coldfire range.

Hi Shiuming,

Yes you're right, I can't stand it either, it's garage music etc, all to be 'listened to' when stoned on drugs and cheap booze (lord am I going to be flamedm but I'm a biggoted old wrinkly so there!!). But it sells and like all crap it's easy to produce by the bucket full once you have the formula. The book I want, is really a second manual for Cubase and is the bible for the subject for atarians. The publishers decided to drop the concentration on Cubase and bring in EMagic Locic etc and THE PC, the only mention of atari in the second addition is in the appendix. Makes me want to spit!!!

Well, don't forget that my proposal was one to produce hardware with
maximum level of compatibility (thus retaining the Falcon I/O 24 bit
space) and minimize the cost of design or production, only adding on
board some existing designs as Eclipse or TT style dual addresing.
And don't forget too that this only was to provide replacement machines
with a little step forward in expandability. This was not a way to get a
revolution in TOS computing, as I stated.
If working on existing design is so painful, even not modifing the
original design, it only remains the software solution if we want to go
on using our ancient, not clean, TOS software, or pray to not find
ourselves some day with our machines functioning no more.

What do I mean with software solution?. And if you read my original
article, I was no confident in having enough free developing resources
among our community to take it to a good end. Perhaps is the same idea
exposed by the Milan team (but unfortunately, I don't understand
German). It means a serious port of MINT, AES and VDI to existing home
hardware plattforms.
I have some first stage ideas about how could it be achieved.
It is to modify or mix the Linux kernel with Mint kernel (simply as a
module or as an stand alone different OS), making use of all the
hardware interface provided with it. This would give the support for
MINT, Gemdos, and some BIOS and XBIOS calls.
As with AES and VDI, VDI could be simply a resident daemon like the X
server, acting only as a bridge between VDI interface calls and X calls
(well, not only this, but for the final drawing procedures). This will
avoid the need to supply and update drivers for the ever-changing world

of graphics cards.
AES and a desktop should be loaded after this VDI.
For old 68k GEM stuff, we should use an special interpreter program (a Falcon and an ST version) to load the code, interprete and parsing it and mapping the OS calls to the external MINT and GEM OS but reflecting the changes in the interpreted memory space That is, each AES an VDI call will be executed internally and externally, mirrored, with the emulated physical screen being a single window in the display.
For non GEM friendly old software we could use the interpreter (to be higly configurable for each aplication, and each one in a separate ST memory space) in a more machine level emulation mode, parsing te video memory to VDI special direct mode drawing.

Now suppose the effort to achieve this. It means:

* Open source x86 and PPC MINT/Linux kernel.
* Open source XVDI daemon.
* Open source well working multitasking AES.
* Open source GEM desktop.
* Open source virtual ST and Falcon interpreters.

What do you think?

Best regards,

Francisco L. Fernandez

I am a visionary. Not a developer. Not a programmer. I am the one who likes to see things others can't or refuse to. No need to rehash what no one is willing to try. I hate seeing my dreams torn asunder by those who can't see the forest for the trees. Or can't see trees where only a bare piece of land exists currently.

I'd surely be willing to MAKE a lead if I knew what pins (wires) to put together. But one set of people seem to say that pin 2 (Composite) exists and another set seem to say it doesn't exist.

I just want to know one way or another before I spend $5.50 on a system that I may not be able to do what I want to on it, which is hook it up to our A/V TV.

Jared

Look, I'm an A+ Certified Computer Tech. I can build a PC, repair them,
upgrade them, and troubleshoot them. I eat, breathe, and live computers!
And have for over 16 years! Where do you come off thinking I know so little,
just because I'm having trouble knowing what pins I need to tie together to
get some A/V video off an ST's monitor port? If the pins are definately
there, I'll get to them one way or another! I just want to make sure I'm
not wasting my time and $5.50 on a system I may not be able to so anything
with. *sigh*

Then we'd go with a G3... and beyond, as needed. PowerPC is PowerPC, is it
not?

> >2) GEM rewritten for PowerPC and upgraded
>
>
> Unfortunately, we don't own the rights to GEM, and we certainly couldn't
buy
> them. Why not make the machine so that it can run current software, which
> would give us time to write a new clone version?

That's what the ST emulator is for. GEM2000 would be a port of GEM to the
PowerPC chip (which apparently no one has done yet). The system would run
GEM2000 (which gives us the ST's desktop look and feel) natively. The ST
emulator allows us to run old Atari ST software on the PowerPC chip in
GEM2000. While we're enjoying playing/using software via the emulator, some
would be working to port their apps to GEM2000 or write new software.

Put simply, what makes an Atari ST an Atari ST? The brand name and case?
That's a part, but it more to do with the OS. No other [new] computer
system (especially a PowerPC one) is using GEM. Why not port it and create,
in essense a new Atari (hence the company name Neotari) ST system that can
continue the life of the ST in a way that doesn't force TOS/GEM to work on
hardware it wasn't designed for? We scrap TOS/GEM (with exception of the ST
emulator) and build some modern hardware and start building a new GEM-based
system that we can run our old apps on as well as apps rewritten for a new
version of GEM.

With exception to the brand name (Atari) and case (any design previously
made) and old OS (TOS/GEM), we would be able to be proud GEM system users,
while secretly knowing that it's the spirit of the ST we're helping thrive
in this new millenium. If old Atari ST apps are rewritten to run in a new
GEM (and old apps run in the ST emulator), we benefit from a faster
processor both ways (remarkably so in the rewritten ones). GEM gets a
facelift and we can stop worrying about how we're all these poor Atarians
suffering with the old ST's and clones that are shriveling up into

non-existance.

We need to break free of the rut we're in (forcing old software to run in a modified OS, running on hardware that is, at best, just a few feet from obsolenscence (sp?) itself). PowerPC is the [very wise] break Apple made, why not us ST users?

GEM/XM (a multi-tasking version of GEM, from what I hear) is written in C and the source code is available. All we need are programmers willing to do the work and get a new GEM revolution going... in a direction no one is trying (rewritten for the PowerPC processors)!

> Dude, you can't start fresh, and have any continuity. That's the mistake

atari?
> Besides, I don't know anything about business, but I know this is a losing
> proposition just by looking at it. Ever wonder why atari abandoned it in
the
> first place?

It will have EVERYTHING in common with the old Atari ST, except it won't be called an Atari ST (the clones sure aren't), the case won't have the look of an ST (the clones sure don't), but it WILL be GEM (which is what the Atari ST OS is!) Just because you rewrite an Atair ST app from one version of GEM to another version and it runs on a different processor, doesn't immediately make that app different. It just breaks the restraints of old technology, allowing the software to be upgraded and improved on better hardware!

Why is Atari ST software so hard to find (and buy)? Because ST's are dead, and clones are dying rapidly. When a system ceases to be supported, software for it dries up as well. What I propose is recreating the spirit of the ST in a new form and giving people a reason to buy them as well as write new software for it! Stop pushing a dead horse down the streets of a ghost town. Buy yourself a new horse and do some sight-seeing!

I believe, beyond a reasonable doubt, that if people knew there was a new system available that used modern technology and ran their old ST apps and had new software being written for it (or old apps ported to the new GEM/processor), they would have reason to buy it.

What makes using Calamus (or whatever ST app you're using) not worth using anymore? The ability to do the work fast enough for your business. If you can do your work faster, why NOT do it faster? If you can do it better, why NOT do it better? An improved version of GEM and a modern processor would allow that!

It really doesn't matter what CPU you use as long as you get out of the rut that keeps you from doing what you want as fast as you can. It could be a Pentium-based system as easily as a PowerPC one (perhaps even easier, since the code base is already Intel-based), but we all know that the PowerPC processor is better, MHz for MHz. That's why we consider it.

If you use a Windows app instead of an Atari ST one that does the same thing, think of why you do. It's because it does the work faster and is more supported than the Atari ST app, right? If you would *rather* use the Atari ST app, you need a way of making it possible or reasonable to do so.

I mean, software does what it's designed to do. Photoshop on a PowerMac is essentially the same as Photoshop on a PC. All things (like software price and system price) being equal, the only reason you'd choose one version over another is the fact that you either already HAVE that specific system or the version you buy runs faster/better on a specific system.

Think of all the apps and games you run/ran on your ST or ST clone. If they ran better or faster on a new GEM system, wouldn't you get that system? What if you knew that a new version was being written for that new system and that it ran 50-100% faster than it did on your old hardware? Wouldn't you want to get it? Some of us like our software for specific "feel good" (loyalty to the GEM's look and/or ease of use or whatever) reasons and other for purely productive reasons. If you're not married to GEM's "look & feel" (possibly also for nostalgic reasons), then it probably doesn't matter what software you run on what system as long as you get your work done. And you won't care about this dream one iota.

But if you want to use old favorite ST programs/games or buy new ones or do your work that much faster, then I don't see why creating a system that allows us to do that is out of the reason of interest or possibility.

Simply put, are you happy where you are as an ST user (I sure wouldn't be as an ST user... too depressing seeing how little life is left in the ST sector) or would you like to go faster and do more and have more as an ST user? I do!

Atari clones are the right idea, but they can't go much further (as evidenced by Milan II's demise) without making a necessary break from the road we're on and start fresh. Go PowerPC. Rewrite (port) GEM! Write an ST emulator! Port old apps to the new GEM! Write new apps for the new system! Have fun being an ST user again without the concerns that your hardware is obsolete and no longer supported (or support is rapidly dying).

If a company makes a new computer and/or keeps the hardware fresh and exciting (and people keep writing new software and/or upgrading current apps) what reason is there to abandon it? NONE! All we have to do is create that new platform and get software support for it. We just have to be convinced that it's the right thing to do and it's possible to do it!

Sure it won't be an Atari. Sure it won't look like an Atari. But you'll be running Atari ST apps on it and seeing new software written (or ported) for it.

Forget about keeping the old going. We have to realize that what software we use today is only running on dying hardware with dying support. It's not the software we need to ditch, it's the technology. With a new heart, the body comes to life once again! And with new life, comes fresh perspectives and opportunities to see what couldn't be seen before!

What I speak of is possible, and profitable, if people will stop nay-saying it and help to make it a reality. It takes people with vision and a willingness to help however they can to bring this dream to reality.

If you don't care, don't say anything, just go on your merry way. If you think it's crazy or impossible, don't say anything, just go on your merry way. But, if you do believe in this, even to the tiniest degree, let your voice be heard. Allow the spark to ignite some small place in your heart and keep it warm, with the hope and dream that a new future can be had for those choosing NOT to live (and be enslaved) in the realm of Microsoft and Apple. GEM is not dead, only hibernating. Shall we let it sleep forever or wake it up and give it (and us) something to do faster and better than ever before?

"Think not that anything is impossible or it will be. What is mere thought can be true reality. What is true reality can be used."

Jared (listening to the MIDI version of the Klax soundtrack... very inspiring!)

Well, if there is a composite video source in there, there is an RF
modulator in there, and there is an RCA connector on the back.

If there is, pin 2 is the second from the right, looking from the outside,
and it is the composite video out. If there is no RF modulator, it is
connected to nothing. Ground is the only pin on the bottom row.

There was a problem correct aIRC for STinG recently and if I recall
it was v1.09. All I can say is make sure you have the latest
aIRC and unload IConnect and anything releated to it for the
time being.

Guess I'm gonna have to take screwdriver and open up the thing to see if it's worth buying then, huh? Hope the people at the thrift shop don't arrest me for doing that... :-)

BTW, If there was an RF modulator inside, wouldn't there be an RF output jack on the back? Or were some made that had the RF modulator inside, but no output jack for it? If so, Atari was screwing up right from the start, huh? It's no wonder they killed themselves with the Tramiels onboard.

Pissed off by the death of my favorite company... other than Kawasaki.

Don't wish to nay-say, but add a few things.
I don't know about you, but a java everything browser would jolt me
out of my rut. Speed per say has never been a huge issue.
Have you ever considered starting a software company?

Anyway, put me down me for a developer machine. When your plan
becomes a reality I may wish to port my IRC client.

Jared,
Sounds like a major undertaking but surely is possible! And (trying
not to sound pessimistic here but real instead) for a lot of us it's
not feasable to come up with the money for yet 'another' computer!
So, speaking for myself, a major boost to most of the Atari's still in
use would be an up-to-date browser (SSL/Javascript). That would initially
stop a lot of the necessary migration to PCs! Even if my stock Falcon030
is relatively slow by today's standards, I'd be happy to use much of
the on-line software made available by hosts and also be able log-in
to most secure servers (chat being last!). That I'm willing to pay for!!!
I don't like not having a speedy processor but access is more
important to me than speed!!! It just seems unlikely that there would be

up-to-date software for yet "another" new system. That in itself would
cause the premature death of any new venture! Maybe this is a bad analogy,
but what good is a trophy winning horse that's not allowed on the track
to compete???
What's needed is clean and current software to go with the "Neotari"
as a package deal (for those willing to spend some bucks) and more
upgrades to the current software and platform to keep us in the game until
we're able to afford better!
Keep the ideas comming though :)
John G.

I think the Atari x86 concept is a better and more viable way to go. (
http://www.volny.cz/phanatic/) It would use cheaper PC clones.

Just my 2 cents..

>

If you are looking for supplies for the SLM605, it's the same
engine as the Epson EPL6000.

Here is the infom from a Replacement toner Cartridge.

EPSON #IBS300
Replacement Toner Cartridge
EPL-6000/ActionLaser/ActionLaser Plus

Also fits: NCR 6435, Mannesmann Tally 906/905,
AT&T 593, Facit P6060, Office Automation System LaserPro Exec,
Olivetti PG 306, Packard Bell P129500,
Toshiba PageLaser 6, Abaton LaserScript I & II, Desktop Systems
Laser Printer, Microtek TruLaser.

The Toner for a605 is fairly easy to get and fairly cheap, however the
Drums are somewhat harder to get and cost over $100 US. However note,
they are easier to get than the SLM804 supplies.

It's an interesting idea. I don't understand why they went about
it they way they did though...

My reasoning being this. In the end what does programing their
stage 1 really get for you? Some expericence programming for the
microsoft world yes, but as far as the further steps go I would say very
litle.

I think launching directly into a port of MiNT for x86 with an
underlayment of FreeDOS (as litle as possible) would have been a more
profitable endeavour. It at least should give them somewhat of a speed
increase. What they have now falls terribly short of MagicPC, which I
think underutilizes the host system by residing on top of Windows.

And not meaning to be a wet blanket, but there will still be a
limitation in the end of what hardware the user will be able to
purchase. Speak to a linux user and ask them if they can go out and buy
any card they care to off of a store shelf. They can't. Why a lot of
companies won't release the full details of their cards or if they will
want a large amount of money for that. Which makes it likely that any
"modern" atari clone wishing for decent graphics will be running a Voodoo
or a small asortment of other video cards. To be honest though I wouldn't
complain to be running my Atari software on a Voodoo 2000 ;)

And as far as the PC version of GEM goes. Why do we care about
it? They didn't come over here for modern software and support, they are
playing around with updating bits of the post lawsuit GEM without
addressing some of it's fundamental flaws. We have better open source
solutions here already.

Dan Ackerman

I'd go along with that too, despite the fact that the ASH IConnect lineup
covers 99% of the range of STinG etc type stuff. Emailer, Chatter, Teli,
Fiffi, it's practically complete.

> 3) Internal IDE port (no floppy port)

UDMA 33, 66 or 100?

> 4) LS-120 drive (doubles as 1.44Mb floppy, if necessary)

What about optical drive, given that
CD and DVD are the most common
software distribution media and have
the lowest cost per MB?

> 5) Two DIMM slots

Why only two?

> 6) 2x AGP slot

Why not AGP 4x?

> 7) Three or four PCI slots

32-bit or 64-bit?

> 8) Audio card (vender yet to be established)

Surely this should be decided by functionality
rather than vendor?

> 9) Video card (vender yet to be established)

Have you considered new technologies
like DVI? Such factors will influence the
choice of vendor, unless you can fine one
willing to manufacture to spec.

> All PCI/AGP cards installed will be soldered in place to insure permanancy
> and security. Tampering voids warrantee.

That's complete nonsense... What will you
do come the day you really need a more
powerful graphics card, or want to replace

the audio card with something more
professional (you sure won't be able to fit
something of pro-quality for a consumer
price) or different features?

> The exact same hardware will be installed in every system to insure
> consistancy.

Why? A computer is not a games console
and must be adaptable to individual needs.
Some people are going to need more RAM
and hard disk space than others. From a
manufacturing point of view it's best to make
a single model, but you seem to be suggesting
making them all the same for no good reason!

If you are talking about STarCall, a demo versions usually are fully
usable and working.
Unfortunately, the last versions (i.e. > 2.6) are useless for me: they
engage all resources of my Mega STE not allowing to keep a transfer.
I suppose, this versions were developed on a PC with emulator, not on a
real ST.

Source record: 56294

Yes its quite simple. All you do is take one common or garden IBM clone.
I usually use a AMD K6 based machine, with Windows98. Into this
machine insert common or garden WIn TV card or similar. Our local
computer fair usually has 2nd user cards for 15 UK Pounds, or about 10
dollars.

Install card in PC and connect composite out from Atari into PC card.

Bingo, you can now use ST on PC monitor. Computer card digitises
Atari Output, and then speeds it up into a form suitable for display on PC
monitor.

..... Or perhaps that's not what the person had in mind :-)

Dave Wade.

P.S. it does work, but its really only good for low res.

The "wheels" also need occasional cleaning- but this requires that the
mouse be dismantled. Brass axes of the wheels rotate in plastic "bearings"
(actually, in holes through a peice of plastic) and dirt soon gets thee
braking the mechanism. If everything is disassembled, these areas
can be cleaned with e.g. a (soft) toothpick point wetted in alcohol.

4091. One case of Atari PCs

Newsgroup: comp.sys.atari.st
Date: 2000-10-15 02:45:03 UTC

First of all, I know this is an ST group, but there might be people in here who collect these beasts, too.
I was recently given a suitcase of Atari PC3 and PC4 motherboards, for which I've been able to find no use whatsoever. However, if you're keeping such a system, or intending to build one (bad idea!), they're yours to keep. Their most interesting features are the Mt. Fuji sign and the ST-type external floppy connector.

Connecting 1040ST to TV video:

Unless you have a 1040stFM, with rf modulator, you don't normally
have video out. Only analog RGB.

A hack is needed to get regular composite video, around the video
shifter. But usually done in the rf modulator.

The method I use(with stock machines) is to open more than one
directory folder window, putting each at the subfolder I need.
Course, I am limited to three, and one destination. But it
works. And I can save desktop to save the postitions if needed.

Sorry not to get back to you on this. Life has just been (and still is)
too busy for me to go looking at it yet.

I haven't forgotten and I'll get back to you one day.

I've no idea where Ulli is at the moment - hopefully busy with the next
up-date :-))

Cheers

Paul

P.S. Now that I 've got my wife's new PC on the desk, it really is good
to have Papyrus on both platforms. No problems transferring files
either, thanks to a SCSI port on the PC and my Syquest. (TOD/DOS
partition works a treat.)

Dreams? Impossible dreams can never come true - that's a fact of life.
The Atari was great in the past and still very useful for it's users,
but it doesn't get developed anymore and to try to start that would
require an enormous amount of both time and money. Besides, it would be
impossible to use anything of the old technology if it's supposed to
compete with anything else - so you'd need to design a completely new
computer and adapt the TOS for it, to get an Atari-like computer. It's
been done to some extent, but how big share of the market do those
clones have? Just about nothing :(

> > You want to design a new computer but you cant wire an existing

> with. *sigh*

Hmmm....
WOW! A certified PC tech?
Anyone can build a PC and anyone can exchange cards until the s**t
works, "troubleshooting" - that's a laugh! - so "PC tech" doesn't say
much at all. I quit working as a computer tech when everything became

spelled "PC", because it doesn't require ANY real skills anymore - it's a total bore for a technician these days. I've built hundreds of PC's and repaired even more - but where's the challenge for a REAL technician when you don't do ANYTHING at component level anymore (you don't even have to use an oscilloscope or have a basic understanding about electronics to "repair" a PC!) - hence don't need any technical skills! You can't call yourself a technician if you can't read a drawing and understand at least something about which signals to use for a simple video output and solder your own cable (just look in the manual - or on one of the sites that have the schematics at hand) - so don't complain when "ordinary" people critizise you for not understanding such basic things. That pisses me off!
You can complain about my leaving the Atari platform, but anything that's said can't stick because I've repaired immense numbers of Ataris and Amigas - and in the good old days, C-64, VIC-20, Atari 8-bit and whatever - at component level - so I'm of the old school of engineers... I've left the Atari platform since I need the speed of a PC nowadays - but I keep supporting it by making some information available on my website - and in this forum among other places. You have to realize that the Atari platform is ancient history now - but it still has it's charms and a LOT of fans still using it - but it can never be revived and start to compete with what's available now, so why you try to make other people do such impossible things for you, I'll never understand...

> as a package deal (for those willing to spend some bucks) and more
> upgrades to the current software and platform to keep us in the game
until
> we're able to afford better!

Just about what appened to the Falcon (in addition to poor marketing,
too high price even after the PC prices started to fall etc...). There
were lots of promises in the start for software and hardware "under
development" for the Falcon, but only a small part of it really came to
the market eventually - and when it did, it was after long delays.
Besides, the machine wasn't built with the TT as a basis - yet another
mistake :(
A new machine still has to be compatible backwards - otherwise you'll
have to make it PC- or Mac-compatible if you're not going to make LOTS
of programming before releasing the new machine - and where's the need
for the new developed software if the machine already is PC-compatible?
A lot of work down the drain, it seems... :(
Another issue: Why start to compete with Hades and Milan on a market
share that's so small already? You would simply risk killing all of it
in the end instead of expanding it.
I believe that a new "Atari" machine will never come true, but new
software would keep current users happy for a long time - so the main
focus for the playform should absolutely be on the software side. If the
speed really was an important issue, there wouldn't have been one single
Atari user left today - they all would have left for the PC or the Mac
platform instead (as very many already have). Actually, I believe most
users actually do have another computer too, but still use the Atari for
nostalgic reasons - and most of them wouldn't be much interested in
investing even more on a new machine that's more expensive than it's
worth because of the lack of new software.

I'm not absolutely sure but I think at least MagiC 6.1 is required.
Simply ask ASH for the details.

Yes, sure. The internal bus is not really different from the external bus. It's just on the opposite side of the cabled, that's all.

> Can they be separate SCSI ids (i.e. 0
> and 1) or can they have the same
> SCSI id, but different LUNs (i.e. LUN 0

You have to use different SCSI IDs, just like with external drives. You can't use different LUNs with hard disk drives except with hard disk drives where one controller on the drive controls more than one drive. I don't know any SCSI hard disk drive where this is the case.

The whole of my Neotari Phoenix idea would be a lot easier if we has the source code to even TOS 1.0! I suspect it would be a lot more feasible to port Atari's GEM/TOS than to rewrite (port) even the latest version of GEM/XM, which has nothing of the ST in mind.

As well, a friend of mine seems to think that, even though C code is fairly portable, GEM has probably got a lot of system specific details that would take heavy rewriting to circumvent. Is this true? If so, wouldn't it be easier, then, to start with something that at least has some ST direction already in it? Or is it the same problem? Porting to any processor other than the 680x0 would be monumental and undesirable to take on?

Was the source code ever released or made available somewhere?

Jared

Yes. VDI has lots of assembler code in it, and even the AES has assembler
parts (for the task switching and some other stuff), and is definitely no
portable C code.

It took me quite some time to get it to even compile using a decent ANSI
compiler, and some more until it worked on the Milan.

>easier, then, to start with something that at least has some ST direction
>already in it? Or is it the same problem? Porting to any processor other
>than the 680x0 would be monumental and undesirable to take on?

Possible, but quite a lot of work.

Additionally, when you start from scratch (or from any codebase that is
different from the original TOS), you will get compatibility problems with a
lot of older programs that depend on lots of small, undocumented
features/quirks[1]. These are programs that probably do not work on
MiNT/Magic, either, but I learned that a lot of existing atari users still
expect to use such programs on a modern machine.

>Was the source code ever released or made available somewhere?

No. Sources to some old DRI Gemdos are available somewhere.

cu
Michael

[1] A very bad example is Cubase, which actively examines the assembler code
of TOS, copies a small part and then modifies it.

IIRC yes. And also IIRC: The latest /official/ version of MagiC has a bug in its FAT32-support, causing wrong results for the free space on a drive. Nothing serious, though, but annoying/irritating nonetheless.

Ciao

Thomas

I don't use Starcall myself. I only have it on my HD.
I recall me that I've had a hard time to install a previous version.
Starcall had serious problems to find my available modem ports. Remember
I'm using MinT/MiNT-net. When it finally found the ports, starcall crashed
everytime I wanted to alter the modem port speed.
The latest versions (since 3.2x) however installs very smootly and find
the modem ports without any problem. No crashes.

It surely looks great and I think it's worth the price.

4116. Re: Atari ST video help wanted!!!

Newsgroup: comp.sys.atari.st
Date: 2000-10-16 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <8sfto4$m4a$1@news.asu.edu>
Source record: 56115

I've got a STfm, and built a cable to connect it to a composite monitor (read "television with A/V inputs"). Works fine in ST Low, works in ST High but somewhat fuzzy. You can read text, but the quality is definitely not as good as the standard SC1224 analog RGB monitor. Fine for games, video projects, etc.

Seems I've plugged this cable into other STs (non-FM) and they worked, too, but don't know if age was involved - the machine I may have tried and worked was a 520ST with the silly power bricks and no internal drive. Fairly old. So the advice here is, try it on your machine and see what happens. Just stick the dressed leads of a hacked up $2 A/V cord into the appropriate holes of the 13-pin DIN connector on the ST and see what happens. You aren't likely to hose up anything by just trying.

As far as pinouts of the 13-pin DIN goes, I think there are FAQs and useful websites around, one or more of which ought to have the pinouts of all the connectors (i.e., a scan of the old user manual). I won't do your work for you, and looking around the sites will do you good. A great place to start is Hallvard Tangeraas' Launching Pad,

http://www.geocities.com/SiliconValley/Bay/8745/index.html

Also, the Atari schematics (not for a ST, unfortunately, but the monitor pinouts will be the same) are at

http://www.fortunecity.com/skyscraper/quadra/455/

If you REALLY need help, drop me a line, and if I feel like it, I will try to find my old manual.

At only 5.5 USD I'd expect them to tell you to ante up the money first!

Have you tried looking around the many Atari web sites to see if there's a
diagram of the video out with pin assignments?

>BTW, If there was an RF modulator inside, wouldn't there be an RF output
>jack on the back? Or were some made that had the RF modulator inside,
>but

The simple answer is that if there's a modulator inside then you'll get an
RF out. Why would a company spend good money on such a device, only to
lock it away inside the case??

I think that you'll find that composite video will be available if there
IS a modulator present - and you can tell that by the model number.
520(1040)STFM would have one, note the "M" for Modulator.

Hi Ken,

KM>my question is can we have 2 SCSI drives on the internal SCSI bus?
why not?

KM>Can they be separate SCSI ids (i.e. 0 and 1)
They must have different IDs!

KM>or can they have the same SCSI id, but different LUNs (i.e. LUN 0 and
KM>LUN 1)
In theory yes, but is there any driver software that supports
different LUNs on the same ID?

If you do like you described above, terminate the TT (the TT's host)
and the second drive, unterminate drive no 1 and don't branch any
external device, unless you'll have to change termination again.

And ensure that one fo the drives provides term power for a usual TT
doesn't do so. But if your system did work with one drive only, term
power should be present.

Und TTschï¿½

The problem is that since they only work with IConnect, they can't be
used in a LAN. And some of them - like Teli and Fiffi - are not nearly
as good as some of the alternatives which works with MiNT-Net or STiNG.
E.g. it would be nice to be able to use Chatter together with aMail,
ssh and NcFTP.

4134. SCSI internal drive/s on the TT question

Newsgroup: comp.sys.atari.st
Date: 2000-10-16 00:00:00 UTC
From: Ken Macdonald <anarkist@idirect.com>
Message-ID: <39EAF81A.F42E1348@idirect.com>
Source record: 56192
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

hi
I am helping out a friend(Aage Nielsen,
exec member at large of TAF)
install an extra SCSI drive on his TT.

rather than go to the effort and extra
expense of using the external
SCSI port, I thought of just adding the
second drive to his internal SCSI
cable. We can take out the existing
cable and replace it with one that
can accept two drives, the cable is long
enough to go out the back to the
second drive, and provide power to the
second drive.

my question is can we have 2 SCSI drives
on the internal SCSI bus?
Can they be separate SCSI ids (i.e. 0
and 1) or can they have the same
SCSI id, but different LUNs (i.e. LUN 0
and LUN 1)
Thanks for any help here

ken

Claiming that it could be profitable is dumb. This is a hobbyist market, and profiting in that context means "rape the atari community". If you want to build the computer because you love them, or you think it should be built, or damn, even because you are bored, count me in. If you want to become the billionaire entrepeneur that ressurected the dead atari ST platform, then you have mental deficiencies.

: BTW, If there was an RF modulator inside, wouldn't there be an RF output
: jack on the back? Or were some made that had the RF modulator inside, but
: no output jack for it? If so, Atari was screwing up right from the start,
: huh? It's no wonder they killed themselves with the Tramiels onboard.

The modulators are in metal boxes with an RCA plug on one face. To put one
of them on the board, you have to have a hole in the case for the RCA plug.

There are STs, STF and STFM. The M stands for modulator. The F stands
for internal floppy.

In other words, no RCA, no modulator.

> and the source code is available. All we need are programmers willing to do
> the work and get a new GEM revolution going... in a direction no one is
> trying (rewritten for the PowerPC processors)!

You are really far out there... I seriously doubt that you have any idea how Ataris are used today, how the OS works or what's available. Porting GEM to get the native desktop look?? You must be joking, or stuck in the 80's. What about MiNT, N.AES, XaAES, fVDI, MagiC, Thing, Jinnee etc? These are free or commercial products tenfolds more powerful than GEM and the old desktop. I don't understand why one would even bother fiddling with GEM on a new clone. And a "GEM 2000" would probably just split the software developers into three camps, instead of two like today. We don't need that.

And then there's the hardware: Why the PPC? It's slower, more expensive and a lot harder to get than e.g. an Athlon in most parts of the world. And why even a new design? It would take a *lot* of money and effort, which is almost certainly wasted since you'll never been able to finance the production.

If you really want "power without the price", do this:

1. Buy a standard PC with an ATI graphics-card and a soundblaster.
2. Write a 68k-emulator (must include PMMU and FPU) with a minimal TOS-implementation. You only need a few (X)BIOS-functions, mostly to get some text-output.
3. Write a bootloader that loads the emulator and MiNT and tells the emulator to run MiNT.

There you go, you have a new "Atari". fVDI will use the ATI-card just fine (yes, it will use the accelerated functions), GSXB with driver will use the Soundblaster and MiNT will allow you to run N.AES or XaAES. You'll have to write some drivers for MiNT (serial-ports, network cards etc.) but you'd have to do that in any case.

This is a much more modern system than GEM will ever be, it will run almost all GEM-apps and best of all, all of it's components are here today, most of them free with sources available. This is the cheapest and fastest "Atari" you can get, and people can walk into any computer shop in the world and buy it.

> an ST (the clones sure don't), but it WILL be GEM (which is what the Atari
> ST OS is!) Just because you rewrite an Atair ST app from one version of GEM

Bulls**t. You don't have a clue. Period.

> I believe, beyond a reasonable doubt, that if people knew there was a new
> system available that used modern technology and ran their old ST apps and
> had new software being written for it (or old apps ported to the new
> GEM/processor), they would have reason to buy it.

Certainly, but they'd never buy your product simply because it wouldn't
work.

> It really doesn't matter what CPU you use as long as you get out of the rut
> that keeps you from doing what you want as fast as you can. It could be a
> Pentium-based system as easily as a PowerPC one (perhaps even easier, since
> the code base is already Intel-based), but we all know that the PowerPC
> processor is better, MHz for MHz. That's why we consider it.

This doesn't make sense at all. The bottom line is that you can get a much
faster processor for less money by choosing AMD or Intel. So what if you
have to run it at 800MHz instead of 450? I'd say that a 1.2Gz
"Atari" would sound more impressive than 450MHz...

> Atari clones are the right idea, but they can't go much further (as
> evidenced by Milan II's demise) without making a necessary break from the

??? And what would you call your "Neotari"? It runs old binaries, it runs
TOS, it looks like TOS (urkh...) but it's not an Atari. That leaves us
with two options: It's either a clone or an emulator.

> Sure it won't be an Atari. Sure it won't look like an Atari. But you'll be
> running Atari ST apps on it and seeing new software written (or ported) for
> it.

The problem is that this "Neotari" is dreamed up by someone who has
absolutely no idea what a "serious" Atari is today. The fact that you
can't even get your Atari (I actually doubt that you use one at all) on
the net but use your PC instead probably says it all.

> way. But, if you do believe in this, even to the tiniest degree, let your
> voice be heard. Allow the spark to ignite some small place in your heart
> and keep it warm, with the hope and dream that a new future can be had for

You must be joking? Jeeez, these new-age airheads...

Yep, that's the way it has to be I'm afraid! You can only get a max
of 2 recipients, by using the Send and CC lines.

4145. Re: Neotari Corp. brings us the Phoenix!!!

Newsgroup: comp.sys.atari.st
Date: 2000-10-17 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <HD0H5.297$qj2.57456@news.goodnet.com>
Source record: 56049

The thing I can't understand is why everyone seems so "anti-improvement" in the ST/TOS scene. Why is everyone so "it's a hobbyist thing"? Are we all just using our Atari/clones for nostalgiac reasons? Seems kinda pointless to me. I like to remember how much I loved my 1040ST, back in '86. But I try not to, because, in all honesty, it hurts too much, realizing those WERE the happiest years in my life. When technology was still something exciting and Atari was doing things others hadn't done (a 1Mb 68000 system for under $1,000? WOW!!!).

But look where we are now? Faster and better technology is all we look forward to. No more innovation, no more real exciting progress. We're at 1Ghz CPU's and climbing. We've got 256Mb systems and 64Mb video cards and 40Gbyte hard drives, not to mention a host of other doo-dads. We're so friggin' jaded, technology is nothing but trivial to us now.

Ok, so where does that leave us as Atari/clone users? Lost and forgotten, that's where. We strive to prove our latest clones or modded-to-death Falcons can do the Internet. Wow. Does anyone really care? I doubt it.

We're living in the ashes, instead of soaring above the clouds. All because no one is willing to admit that the way things are is no longer worth a hill of beans to anyone!

All I'm saying is that we break out of this ghost town we're living in and make some innovative new steps for us to all follow in. Sure it won't be the latest technology. Sure it won't be the fastest. Sure it won't be the best.

But it's a whole lot better than living in the nostagic past forever, trying to justify keeping your ancient piece of Atari-era crap and make it do the Internet a fraction as well as any lame-assed 486 PC can do with a decent PCI video card running Win85!

Atari did us wrong, commited suicide, and left us to suck on the bleached white bones of their corpse. Gee, life is grand ain't it? And we've been trying to make due with what's left, ever since!

I left the Atari scene years ago and, except for that pesky memory of nostalgia, haven't looked back since. But I'm always wishing it could have been different, that Atari was still alive and well and not just some namesake of Hasbro. But the timeline has played out this way an we have to live with it.

All I'm offering is a dream that says, take the old software, rewrite it for a new GEM written for PowerPC (or Pentium, for all I care!). If you truely cared about using the software for more than "reliving the past" (which is nothing but a waste of time anyways), you would see what I'm saying has

purpose.

Time and money and effort are ALWAYS part of the equation. Especially where change is concerned. I mean, are we just going to stand there at this dead-end we're left at, or are we going to back up a few houses and go down a road we haven't travelled that at least goes somewhere a few years longer if not infiniately longer?

The point at which one can stop seeking further progress is when all your needs are perfectly met. When your system does EVERYTHING as fast as you'll ever need it (or as fast as it can be done), when the software is flawless and the games are perfect.

But that time isn't yet.

If I bring to the table one vision, imagine this:

Any application you run, running significantly faster!
Any game you play, being that much more exciting!
Any software you use, being that much better!
Any software ideas not yet created, now being available!

Now assuming that software/game/application runs on an Atari ST or clone, where does that leave us? With a task ahead. And living in the past and pushing aging technology in directions it can't go, is not going to get us there.

Software development is fueled by hardware potential. The reason so few are still developing software is because the hardware (clone or not) is at it's life's end. It's been pushed, and hacked, and prodded in every direction within the confines of the 68K series. And that road is exhausted. Utterly and completely.

And I believe it's time to jump the tracks, take what baggage we can that doesn't hamper our progress, and see where we can go from there.

If the Atari ST software doesn't matter, then none of this matters.
If The Atari ST "look and feel" (OS) doesn't matter, then none of this matters.

If we're not trying to keep the spirit alive, then it's truely pointless to continue. Even if the spirit is called something else and lives in a different system, it's still the same spirit.

If you run a favorite application that originally ran on an ST, but now runs on a system that has a similar look OS-wise, but a newer, faster CPU. Is it not the same application? As long as we remember what we're doing and why we're doing it, it doesn't matter if the app runs on a PC that runs GEM or a GEM system that runs off a PowerPC.

It's the apps and operating system that makes us happy. And if changing direction, to allow us new opportunities to innovate and create, is what we need to do, then why not do it?

Money, right?
Time, right?
Effort, right?

Is it worth it or not? Is keeping up with the times and not scraping in the dust worthwhile or not? Or does anyone care anymore... except for nostalgia?

If I could forget my past with the ST and Atari, I gladly would. It's simply too painful to remember all that potential screwed straight to hell. All I'm trying to do is make it possible to remember the past fondly and yet also be able to say, "look at where we've taken it!". No one but us is going to make a change. Atari won't. Hasbro won't.

Am I just yelling to the breeze? Am I calling upon completely deaf and uncaring ears? Am I the only one who is so friggin' tortured by the way things have turned out that I desparately want to see a change, regardless how impossible that change seems to accomplish?

All it takes is people who know how and are willing to program
All it takes are people who know how and are willing to design the computer
All it takes are people with a little money to band together

Nothing is accomplished overnight. Nothing worth doing right is going to necessarily be cheap or easy.

But it's possible, regardless what people say. If only we all care enough to achieve it.

Are you?

You forgot the most important point, apart of Cab they all need MagiC in order to work. Even the latest Iconnect needs MagiC now.

Why are you still messing about with TOS, and even worse - PC-GEM?? Have
you any clue on what's been going on in the Atari community the last ten
years?

> Was the source code ever released or made available somewhere?

No. But if you really want a starting point and seriously consider porting
a GEM/TOS-compatible OS to a new platform, take a look at FreeMiNT and
XaAES (or oAESis).

To some extent, I agree. However, the way to go about changing this, isn't some dumb quest to start a new corporation. This would never be profitable. Desirable though? Maybe. Even so, there are a great many intellectual property hurdles to jump, and after that, even more and higher technological. It might take several months to even figure out what a nextgen ST should be. I don't think it has to be relegated to some obnoxious emulator for windows, and it doesn't have to compete megaherz for megahertz. Me, I'm still looking for an ST that I can afford, as I've made something of a hobby of collecting computers, 68k series in particular. I've also toyed with the idea of making my own hardware, and let me say this on the subject, IT IS NO TRIVIAL TASK. Calm down a bit, and let's talk about what the computer should be first, until then we can't even be sure it's possible.

Thanks,

>P.S.: With 32MB, the sector size (essentially the size of each
>storage 'chunk') is 512 bytes. This means that even if you write a
>tiny two word text file to disk, you still use 512 bytes of space on
>the HD. As things grow...

It's worse than that! TOS, DOS, MagiC etc can only access clusters,
which are normally 2 sectors, so the smallest you can use is 1 KB! In
the same way the figures should be doubled for the larger partitions.

I believe the reason is the limitation of the FAT size, so the number of
records that need to be kept stays more-or-less constant as partitions
get larger. In theory one could use clusters of 1 sector for small
partitions, but I'm not sure that TOS etc, could handle that.

I agree with your recommendation - 32 to 50 MB is enough for C:, which
should not have too much on it anyway apart from the files needed to get
the system up and running (includes AUTOs, ACCS, START and probably path
and environment files etc). This is for safety - write as little to C:
during normal use as possible has always been my motto!

aIRC is coded in GFA-Basic, gasp! :-) Anyway, apart having a few
people initially tell me they thought GFA probably could not be
used for STiK access, I think I did an OK job. To some extent
lucky to have gotten to this point at all. I honestly don't
know how to interface IConnect to GFA, and it would be another
major research project. I spent a good month if I recall working
out the STiK interface and GFA. I guess I've become a bit lazy,
plus I don't really wish to code for a closed stack.

I understand the dream, we all have had it however in order
to take you serious I'd like to know a few things.

Your age?
How long have you been an Atari user?
Do you own only Atari's? Or have you already given into the pressure?

If you have not progressed to at least a TT or Falcon, or a
clone, a wacked out ST, pushed the envolope, gone to the edge,
hit that wall... then not to many people are going to take you
serious. I may be completely wrong, but you come of as an old 520ST
user who refuses to move up to what is available.
That is not meant to be mean, it is just my honest
feeling. If I'm wrong I'm sorry.

Many of us here have lived this and are still doing that.
I still have room to grow... I have not hit the wall yet
as far as hardware is concerned...

I must confess I've done this - and I managed to get a pretty high quality
medium-resolution display on my WinTV card by tweaking the contrast
settings in kWinTV, and setting 'white' to be light grey in Xcontrol on
the ST.

Hey presto - almost usable... :-)

Last Atari I owned (new) was an Atari Falcon030, that lovely piece of hardware Atari stopped supporting, right after it was released, to pursue the gaming failure known as the Jaguar, just moments before they comitted suicide and screwed us all royally. I suppose it was fate they would go to JTS and JTS went bankrupt as well... The Tramiels... a plague upon mankind... a pock of nightmare... a curse waiting to happen...

Where the (!!!) are they (the Tramiels) today?

Fair point about LAN (but I wonder how many people are using a network?). I will argue with you about Fiffi though, with Scripter control and a Resume function it knocks spots off both NEWSie's ftp section and aFTP, however I much prefer aFTP's interface over Fiffi's.

>E.g. it would be nice to be able to use Chatter together with aMail,
>ssh and NcFTP.

Maximising your online time, I can certainly go along with that! :-)

BTW, I tried aMail out yesterday - after adding the necessary incantation to the config file to add NNTP support, it downloaded message headers OK but they weren't displayed anywhere, so there was no means of downloading the bodies themselves? This part of the program seems to be more of an afterthought. It also wouldn't load the default.cfg file at runtime, however that might be because I was running it under MagiC.

It's unfortunate that the latest version available in the UK remains at
6.01, and that ASH will not sell to people who live outside Continental
Europe :-(

I suppose it's not such a big deal, when's all said and done.

>Bob King.

Hi

Going moderated would not be a good idea.

To be properly moderated the moderator would need to be impartial,
otherwise their opinion would mirrored in the posts.

There is also a delay in posting, crucial in time related postings. This
delay can be substantial depending on the work load.

It also MAY put people off posting, especially newcomers. Also newcomers
may have their posting rejected because the question they are asking
have been asked time and time again.

The best way is self-moderating, if you know a plonker is being a
plonker! ignore it don't read it, and we all know what spam is and how
to avoid it. If the spam is contravening what it's advertising, then
make a complaint with the body that's being advertised, e.g.
Alladvantage ...

I have subscribed to moderated groups before and the disadvantages
outweigh the advantages: 2 days for a posting/reply to appear and then
at the sole discretion of the moderator!!!!

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

The only drive I've ever found that makes effective use of different
LUN's is the Panasonic PD650 which uses LUN0 for itself when it is a
650Mb MO drive and LUN1 for itself when it's a CDROM drive. You need HD-
Driver with the <Check for seperate LUN's> option checked in Advanced
settings, and you need SPIN to drive the CDROM side of it....and you
need to have a PD650cart in it when it boots up.....

Hi Shiuming,

I am surprised. I thought that this was a News Group set up for the original purpose of news groups, ie for people with a common specialist interest, having various degrees of knowledge in that subject, where the beginer could learn from the expert and the subject thus kept from dying. People like S*****p, (don't you realise he trawls the NG's for a mention of his name, with the sole purpose of polution) exist soley to provoke and perpetuate havok. Have you looked at comp.sys.advocacy lately, do you realy want this NG to become like that, a haven for the disaffected, affected moron.
He would not be the laughing stock, we would!

Bob King.

4187. Annoying little MagiC-problem

Newsgroup: comp.sys.atari.st
Date: 2000-10-17 00:00:00 UTC
From: Jo Even Skarstein <joska@online.no>
Message-ID: <8shkjr$i2m$1@nnrp1.deja.com>
Source record: 56139

I have a small, but very annoying problem with MagiC on my TT: I'm using Thing as desktop, and when I try to shut down MagiC - either by pressing ctrl+alt+delete or running shutdown.app - Thing and all of the applications and accessories are terminated and then MagXdesk appear. If I then press ctrl+alt+delete again, MagiC reboots without first flushing the wb-cache :-(

I'm using a very early MagiC 6.x, possibly 6.00 or 6.01. The TT has a Crazy Dots II graphics card with NVDI 5.00, and I'm using STiNG 1.26 (PLIP only).

Hi Steve,

Yes, I reluctantly agree with the reality of all you say above, but the truth
is, that although you and I read all the string of postings from these guys, rapidly
realise the dross of their worth and do not rise to the latest fatuous question,
someone always does bite and so it goes on.
We are an endangered species, limited in numbers by lack of new food, but an equal,
if not greater danger is the spread of a corrupting energy sucking virus.

>

But I would say it has several strikes against it.

1. All commercial.
2. All closed source.
3. Virtually no interest in having anyone else write for their
TCP/IP stack.

Then we look at what choice you have of clients.

You list one of each above with the potential of running clients
under an emulator. I have the choice of at least a half dozen email
clients, a couple of IRC clients, a couple of ICQ clients, several FTP
clients, a few different CAB.OVL's... the list goes on. And I'm using
STiK.

Now if I were using MiNT Net I could increase that list again on
each of the options + some options for clients that the average person
doesn't even know exist.

Now lets look at the first two topics listed above.

Commercial? Only commercial internet client for STiK API that I
know of is CAB (a product of ASH). Most are shareware or freeware
applications.

Open source? While not all the clients are open source there are
many that are open source. Beyond that I can verify for you that both I
and Ronald Anderson have spent 100's of hours over the last several years
helping programmers to get their clients functioning or helping track down
those elusive bugs.

In the end I think it breaks down to the old problem of a company that can't see past it's national boundaries. Here is a question and an illustration of that. Why were english language versions of CAB released months after the German version, even though as a beta tester of CAB, I always had an english language RSC? I'm quite serious I would get an english RSC file whenever I got an updated CAB beta, yet I would hear how the RSC had to be translated before an english language version could be shipped.

Well that's enough of a rant for one day.

Could be more than that JI. I'm not sure but maybe it needs it's
chips reseating. Usually a white screen is produced if no disk is in
the drive, or the HD is not booting.

To reseat the chips take the top off and clean with brush, lightly.
Then press down, be quite firm, on the socketed chips so they creak.
If that doesn't help you may need to remove the chips and clean the
contacts with some sort of alcohol.

> TJ

hi thomas

try this
you have decided to send e-mail to someone, and cc it to four others.
fine, select the To:, and put one e-mail address in the CC:
then click on edit
(I use qed, but I think this may work in any test editor you have set up
provided you can access the GEM clipboard)
At the top of the mailtest.txt file now open is the header info on To:
and CC:
Going back to Newsie momentarily, click on open address book, and edit
the address you
want to add to the CC: line.
click on the line with the e-mail address, hit Control-C (to copy) and
close the address,
go back to qed, click behind the already placed CC: address, making sure
you add one
space between the addresses, and Control-V (to paste)

i.e.
to: whats@hisname.com
cc: fred@flint.stone barney@rubble.roc bam@bam.bam pebbles@stop.this

as their are no spaces allowed in email addresses, the space is parsed
as denoting
an addtional address.
quite convoluted, n'est ce pas?
;-)
but it works

Is it possible to send an email with Newsie 0.94 to multiple addresses? I had occasion a while ago to send an email to someone and I wanted to CC: four other addresses from my address book. I couldn't figure out how to get more than one address on either the Send: or CC: address lines. I finally had to do it the hard way, creating seperate letters for each set of two addresses. What a pain!

IIRC you can set up a nickname that has multiple addresses. Sending a
mail with the nickname as the recipient should result in the mail being
sent to all those addresses listed for that nickname.

>nuisance.

The best filter mechanism you can get is yourself. An idea would be for you to look at the posters name and, if it's someone you think is clueless, or a troll, mark the thread as read and continue elsewhere.

Turning this group into a moderated group isn't a good idea in that you may annoy the moderator and end up being unable to post to the group. There would be a delay introduced in posting which would remove the spontaneity of the group. And, most importantly for me anyway, would remove my choice of whether to read the posts by whoever the moderator decides not to approve.

Finally, what happens if the moderator disappears, as happened with comp.sys.atari.announce a while ago? For a long while that group was as good as dead, and that isn't something that I'd like to happen to this group.

David Bolt

So I understand, though I found it hard to get much info from the website, which is rather incoherent.

I think there's a great deal of profitable ground in the two groups co-operating, though.

I think GEM on Linux could work REALLY well, in two scenarios:

[1] under X, as a GNOME/KDE type thing. A simple small fast window manager/desktop environment with an existing applications base and know-how.

[2] Under raw console-mode Linux, perhaps via the framebuffer, as a low-resource graphical system with much less complexity than X.

But how do we get the two together?

Just out of curiousity are the repeat posts random or do they seem
to be linked to one or a few specific people?

With Outlook at work I will get multiple postings from some people
from time to time in this group. I always just assumed it was something
on their end. Although I don't think I've noticed as many with trn (but I
use that on a different news server).

: would need to change over to the Coldfire range.

So the "highly relevant custom chip, highly integrated into the
motherboard design" is actually the 68060 CPU. That is a good joke isn't
it. These people should be in marketing.

As for using the Coldfire instead, that is an even bigger joke. (Motorola
just announced a new Coldfire core which would be much more useful for
this, but the first standard parts using the core will not be available
until mid-2001.)

Yes after a long time, but while it was waiting for the GEM desktop to
appear the screen was a plain white screen. In the original post he
said the screen was black.

If you've tried pushing on them a bit, then you'll need to remove them
and give 'em a good cleaning. The square PLCC chips are quite
difficult to remove without the right tools.

Best way is to use a very fine flat screwdriver and prise them
out from each corner, a bit at a time. Quite a few of the sockets
have only two holes at each corner to put a screwdriver so these may
be more difficult.

Have you tried cleaning the TOS chips (not sure where they are on the
Mega ste). They're socketed (2 of them) just do one at a time, so you
don't get them muddled. It won't harm it putting them in the wrong
sockets though (I think!)

Good luck ;-)

What does that matter? I'm 15 but who gives a monkey!?

>How long have you been an Atari user?
Again, does that matter. My first computer was my STe when I got it
in Nov '95. And it's still here sitting on my desk.

>Do you own only Atari's? Or have you already given into the pressure?
I have 3 STes and an old STfm. A 386 laptop, and that stinks. My
internet connection remains with my STe.

>If you have not progressed to at least a TT or Falcon, or a
>clone, a wacked out ST, pushed the envolope, gone to the edge,
>hit that wall... then not to many people are going to take you
>serious.
Why not? You find me a Falcon or TT near me (Bristol, UK) and I might
buy it. I don't want to by on ebay because

1: It's too expensive for what you get
2: I can't go a check it out
3: Shipping cost's an arm and a leg

I did find a Falcon with CAF16 etc but it was gone in about 4 hours of
the paper coming out. The guy said I was about the tenth person to
ring up that day. All I see locally is stacks of old 520 ST's with
games. Not my cup of tea at all.

Sure, the new Macs are fine, but atleast here in Norway they're almost
twice as expensive as equally spec'ed PC's. And since I don't really like
either of them, I'd choose the fastest and cheapest.

Hello.

> I just bought a mega ste 4 to start up my homerecording studio

A good choice. Genuine software of course.....

> It worked fine for a few days but now it has problems starting up. The
> screen remains black although the harddrive start running. Only after
> a long long time it will eventually start up.

I speak from experience, I have three Mega STEs.

At switch on you should see the white screen with the Atari logo top left.
If you leave it to boot it will perform a memory test and allow the hard
drive, if fitted, to settle. It will then autoboot from the hard drive if
set up to do so. A blank formatted disc in drive A will speed this up.

If you are happy your memory is OK and the hard drive is up to speed press
the space bar, the machine will bypass the wait and boot.

I have had many customers with this 'warm up time', a service sorts out 99%.
Some of the chips in the Mega STE are tricky to extract and broken sockets
are a nightmare.

I do not advise jemmying with a screwdriver.

If you need it servicing ring 01925 266120 to arrange.

Barrie at Keychange.

I would think that it isn't so much the availability of the 060,
thousands are used in the embeded market (and Amiga market as well),but
more likely they couldn't get a decent price with their limited
production runs. I have some, and they ran between $180.00 and $230.00
each. It would be hard to market a sub - $1000.00 (USD) computer with
the CPU's each costing that much.
I guess in reality, unavailable and cost prohibitive are one in the
same.

Mike

I don't understand quite well what you means.
AFAIK, one can't download the headers first and then make a selection of
the articles one finally want to retrieve.
aMail downloads directly the messages. You can read then the same way you
read mails
The list of newsgroups you've downloaded are found in the first dropdown
menu usaly INBOX stands. They can be found in the NEWS entry.

The messages itself are stored, al least on my set up in /home/root/amail

-rw-rw-rw- 1 root wheel 338575 Oct 18 18:32 comp.atari
-rw-rw-rw- 1 root wheel 319364 Oct 2 21:28 inbox

This sounds VERY sensible (about the most sensible comment in this thread,
I am afraid), and it could be done in some reasonable time.

A new "atari" hardware that would be available in, say, four years (maybe
that's the time needed to develop such a design?) has no chance ever to
materialize but I suppose that a basic 68k emulator like the one you describe
might be made in several months if someone was willing to make the effort.
Would the people that maintain and develop MiNT be interested in such a feat?
I think they are the ones that would be the most qualified to integrate
seamlessly the emulator, MiNT, N.AES (or XaaES or whatever), Thing or Jinnee.
Maybe parts of emulation code for some of existing emulators (StonX? - free
source) might be used to speed up the realization?.

For fun, I have tried setting up an autostarting multitasking environment in
TOSBox on an average PC: TosBOX 1.10 + TOS 2.06 + MiNT1.12 (newer ones don't
work) + NVDI 4.11 + AES 4.1 (not ideal, I know, but I don't have N.AES) +
Wdialog + Jinnee 2.1 (demo, unfortunately).

It came out very handy and fast and quite impressive with 1024x768 screen
resolution, and gives some approximate impression of a machine you describe.
Quite a lot of software works perfectly, and I suppose that most of that
which doesn't work can be made to work because it runs ok on some other
Atari emulators.

No, Jo Even, it would not be better to run in on standard PC. If there is any truth to the Milan III rumors (PPC thingy), I would much rather pay a lot more for such a machine than a PC. I can't explain why I think this way, I just do. I don't find any personality in those PC boxes, or something like that :)

I don't give a monkey how old you as are I was not talking to you.
So you are right it don't matter. ;-)

However if Jared wishes to toss such grand ideas around I want
to know some background information! I've been beating on Atari's
longer than you have been walking this earth apparently and
so I think it is fair to ask such questions.

Well, I know that any version I have runs on a 1040ST upgraded to four
megs. Somehow, I do not think you have a problem.

It should be found on umich archives.

Hello,

Just to let people know that back issues of Atari Computing will be
available from us at the show, along with quite a few second-hand British
and American ST magazines at very cheap pocket-money prices :)

Also, we'll have a little surprise in store...

The 060s were always high... by the time they were ready to ramp up production of them, Motorola had already decided that it wasn't really worth pushing. In their defense, the 68k line of cpu's couldn't have been extended more than 1 or 2 generations past that, tops. The 603e is hardly the pinacle of PPC chips, but at $44 (less in quantity) I think someone needs to find a decent way to substitute them. Just hope everyone isn't waiting for me to do it. ;-)

Thanks,
John

Very interesting to read this.
Maybe you should try GEMULATOR? I have understood that tosbox doesnt emulate
all the hardware, only just enough to run clean GEM programs.
Perhaps Gemulator can run newer MiNT versions? There is a free version.

If not, I can prepare a XaAES version that runs on MiNT 1.12

If I remember well, I must have a 500MHz pentium somewhere around. :-)

Absolutely, I've lost count of the messages that have succumbed to the "Delete" key unread due to the complete lack of thought that obviously went into the reply. I've been thinking that the task of a moderator in this and the allied NG's could be more of an advisor on such topics as the inadvisability of quoting an entire message to put a "Me too" at the end?

|The thing I can't understand is why everyone seems so "anti-improvement" in
|the ST/TOS scene. Why is everyone so "it's a hobbyist thing"? Are we all
|just using our Atari/clones for nostalgiac reasons?

I am not anti-improvement but I am anti pointless dreaming. I use my
Hades seriously all the time. I do letters, reports, scanning, OCR
work etc. The reason I use an Atari at all is the ease of use of the
OS and programs. I use a Hades because it is faster and has more
memory. Large images are no problem. Papyrus is great, particularly
on the faster machines.

I would be happy to buy anything that was of the same simplicity but
was significantly faster. Phenix is gone, Milan II seems to have
gone. What will I do if the Hades gives up? If you are prepared to
design and sell a better machine that will run my programs I will
buy it (if it is not too expensive). The new MagicMac running on a
bare PPC Mac sounds ideal.

| . . . .
|But look where we are now? Faster and better technology is all we look
|forward to. No more innovation, no more real exciting progress. We're at
|1Ghz CPU's and climbing. We've got 256Mb systems and 64Mb video cards and
|40Gbyte hard drives, not to mention a host of other doo-dads. We're so
|friggin' jaded, technology is nothing but trivial to us now.

I can't help feeling that your argument lacks logic. Are you for new
technology or against it? You seem to be against it here and for it
in your argument below.

|Ok, so where does that leave us as Atari/clone users? Lost and forgotten,
|that's where. We strive to prove our latest clones or modded-to-death
|Falcons can do the Internet. Wow. Does anyone really care? I doubt it.

I don't care whether any outsider using a pc cares or not. If they
can only see multimedia etc and not the practicalites then more fool
them.

| . . . .
|All I'm saying is that we break out of this ghost town we're living in and
|make some innovative new steps for us to all follow in. Sure it won't be
|the latest technology. Sure it won't be the fastest. Sure it won't be the
|best.

What is the point of striving for something if it is not the
fastest and the latest technology? You already have old, slow

technology in the form of a basic ST.

| . . . . .
|I left the Atari scene years ago and, except for that pesky memory of
|nostalgia, haven't looked back since.

Why jabber on at people who stuck with Atari?

| . . . .
|All I'm offering is a dream that says, take the old software, rewrite it for
|a new GEM written for PowerPC (or Pentium, for all I care!). If you truely
|cared about using the software for more than "reliving the past"

Sounds like fast, new technology! And why do you assume that we are
all just reliving the past? That is what you wanted to do by
re-starting "Atari." The Atari scene only survives because people
are USING their machines and their programs.

| . . . .
|If we're not trying to keep the spirit alive, then it's truely pointless to
|continue. Even if the spirit is called something else and lives in a
|different system, it's still the same spirit.

| . . . .
|All it takes is people who know how and are willing to program
|All it takes are people who know how and are willing to design the computer
|All it takes are people with a little money to band together

Well, that shouldn't be too difficult given a weekend or so.
Alternatively all we have to do is wait for the new MagicMac.

network?). I

Quite a few I would guess. There's already a lot of people that connect their Atari to the net through a PC or Mac, simply because they want to use both at the same time and because their Atari doesn't have the necessary hardware (i.e. ethernet-card).

> will argue with you about Fiffi though, with Scripter control and a
Resume

I personally use either NcFTP, Midnight Commander or just plain BSD-ftp, simply because I find them easier and faster to use.

> >E.g. it would be nice to be able to use Chatter together with aMail,
> >ssh and NcFTP.
>
> Maximising your online time, I can certainly go along with that! :-)

Exactly. And this can be done if the specs to IConnect is released, as it would allow people to write IConnect-overlays to STiNG/STiK and MinT-Net. It has already been done with Draconis (for STiNG and MiNT-Net) and STiK (GlueSTiK for MiNT-Net).

It's possible that ASH believes that this will reduce profit, as their users no longer needs to buy *all* their internet-tools from them, but I believe the result will be the opposite: If you can use IConnect clients together with STiK/STiNG, Draconis and MiNT-Net clients, more people will buy e.g. Chatter and perhaps ASH Emailer.

> BTW, I tried aMail out yesterday - after adding the necessary
incantation to
> the config file to add NNTP support, it downloaded message headers OK

I have never used NNTP with aMail (it's always faster to run tin remotely), but I believe it's far from finished.

Jared (if that's your real name),
Your not a devolper or a programmer and your "visionary" skills need
glasses as thick as the bottom of soda bottles!!! I'm not not a developer
or a programmer either but sometimes I can tell when someone is dishing
out a lot of sheep dip! And all over $5.50 ??? That's a real bank breaker
there!!! Why don't spend some of that wasted energy on learning how to
acrue a better reputation instead of earning one of a disruptor? Try
talking to some of these good programmers here in this NG (who have
already earned their wings) about what has already been tried and how
the Atari evolved before you go making demeaning remarks about
willingness, dreams and trees!!!
Or better yet, start a new thread (as you've done before) as if no
one here can read either!!!

I've bought a Phantom SE, the instructions are nice and clear, the qulaity of the PCB's is OK, I've fitted the 44kHz clock part to my home Falcon and it works perfectly, detected by both Aniplayer and Falcamp. I'll be fitting the accelerator part to my studio Falcon, it look sto be very similar to the Nemesis, ie not for beginners, but if you know your way around a soldering iron (and have a nice low-power one with a fine tip) then you'll be OK...

It's a good idea, but it would be better to run it on standard PC
hardware instead. Macs are slow, expensive, hard to get and have poor
support for other operating systems than MacOS.

This exactly what OSIS is, although there is no activity in the
project for the moment. There is even some m68k-emulation support at
the moment, and some atari-gem programs run, at least under
linux-ppc. Under linux-x86 there are endian problems that need to be
solved, but at least Atari's LINES.APP run emulated on that architecture
:-).

I may have the name wrong, but I believe Bruce Noonan wrote
a version of ST Writer that had enlarged text for the
visually handicapped.

Does anyone know if a version is still available that will
run on a 520ST that has been upgraded to 1 meg?

Thanks.

Ken

> Was the source code ever released or made available somewhere?

Yes!

ST GEM is based on GEM 1.0. DR itself continued to develop GEM up until GEM 3.1, and incomplete versions 4 and 5 were released by third parties - but this is only the Intel PC version.

It's source-compatible with ST GEM, and a couple of years ago was made open-source under the GPL by the current owners of DR's intellectual property, Lineo Inc. (http://www.lineo.com).

There is a project running to update FreeGEM, currently based on DR's v3.1 sources, with the features of ViewMAX 1, 2 and 3 and GEM 3 and 4, as well as achieving functional parity with later ST releases.

Much of the low-level work has now been done.

The project's homepage is http://www.deltasoft.com and we welcome any and all people who are willing and able to contribute.

We have two targets. One a modern, fully-functional GEM that still runs on MS-DOS compatible OSs in Real mode - i.e., on an Intel 8086 or compatible. Small, fast and efficient.

The other objective is to create a portable multitasking GEM running on top of Linux or some other multitasking OS. This would then be able to run on various non-Intel architectures, such as PowerPC or ARM.

It would certainly be possible to write a 680x0 compatibility layer for this to allow ST GEM applications to run, and some of us would love to see that happen.

Why are we so "anti-improvement"? Because the "improvement" in question is
being proposed by an utter quack.

>But look where we are now? Faster and better technology is all we look
>forward to. No more innovation, no more real exciting progress. We're at

>40Gbyte hard drives, not to mention a host of other doo-dads. We're so
>friggin' jaded, technology is nothing but trivial to us now.

True. And 40MB HDs are quite handy. I can back up every other hard drive on
the network and still have ample space. CD-ROMs are antiquated by now, I can
just keep it on-line all at once. ^_^

>Ok, so where does that leave us as Atari/clone users? Lost and forgotten,
>that's where. We strive to prove our latest clones or modded-to-death
>Falcons can do the Internet. Wow. Does anyone really care? I doubt it.

You certainly don't. I don't really know what your business is here, since you
don't use your Atari (Have you ever tried a modded-to-death Falcon?).
Besides, the Falcon is completely tangible, whereas the Neotari is not.

>We're living in the ashes, instead of soaring above the clouds. All because
>no one is willing to admit that the way things are is no longer worth a hill
>of beans to anyone!

Wrong. It's all because of Atari and Atari users and market forces et al.

>All I'm saying is that we break out of this ghost town we're living in and
>make some innovative new steps for us to all follow in. Sure it won't be

And you certainly aren't the harbinger of a new era in Atari computing.

>If I bring to the table one vision, imagine this:

>Any application you run, running significantly faster!

Get a Hades.

>Any game you play, being that much more exciting!

Get a Playstation.

>Any software you use, being that much better!

Get an Amiga.

>Any software ideas not yet created, now being available!

Get BeOS.

>Now assuming that software/game/application runs on an Atari ST or clone,
>where does that leave us? With a task ahead. And living in the past and
>pushing aging technology in directions it can't go, is not going to get us
>there.

Is that some kind of mantra of yours? It keeps reappearing every second
sentence. Have you even once tried out this aging technology pushed to its
limits?

>Software development is fueled by hardware potential. The reason so few are
>still developing software is because the hardware (clone or not) is at it's
>life's end. It's been pushed, and hacked, and prodded in every direction
>within the confines of the 68K series. And that road is exhausted. Utterly
>and completely.

Untrue. The ST was absolutely static in the hardware department for seven or
eight years. It enjoyed an immense software production.

>And I believe it's time to jump the tracks, take what baggage we can that
>doesn't hamper our progress, and see where we can go from there.

You have already chosen your path. Now, when you have a Neotari, please come
back. Vapourware is not all that exciting in a community which has been ridden
by far too much of that from every corner.

>If the Atari ST software doesn't matter, then none of this matters.
>If The Atari ST "look and feel" (OS) doesn't matter, then none of this
>matters.

>If we're not trying to keep the spirit alive, then it's truely pointless to
>continue. Even if the spirit is called something else and lives in a
>different system, it's still the same spirit.

True. Your point being?

>If you run a favorite application that originally ran on an ST, but now runs
>on a system that has a similar look OS-wise, but a newer, faster CPU. Is it
>not the same application? As long as we remember what we're doing and why
>we're doing it, it doesn't matter if the app runs on a PC that runs GEM or a
>GEM system that runs off a PowerPC.

Please stop spouting all those platitudes, they are only relevant when
applicable to a real-world situation.

>It's the apps and operating system that makes us happy. And if changing
>direction, to allow us new opportunities to innovate and create, is what we
>need to do, then why not do it?

It's the apps and operating system that makes us happy. That's why some still
use Ataris, even though the hardware may leave a lot to be desired.

>Money, right?
>Time, right?
>Effort, right?

You're bloody right!

>Is it worth it or not? Is keeping up with the times and not scraping in the
>dust worthwhile or not? Or does anyone care anymore... except for
>nostalgia?

You're the one being nostalgic here, reminiscing of your old glory days with
the ST. You haven't run one in years, and are thus a relic. You're an
anachronism in this particular context, and your knowledge of the current
Atari scene is about as deep as that of Giuglio Marconi's in the field of
integrated circuits.
Please, comp.sys.atari.st is not a fairground for your sentimental journey,
and its inhabitants are no tourist attractions.

>If I could forget my past with the ST and Atari, I gladly would. It's
>simply too painful to remember all that potential screwed straight to hell.
>All I'm trying to do is make it possible to remember the past fondly and yet
>also be able to say, "look at where we've taken it!". No one but us is
>going to make a change. Atari won't. Hasbro won't.

And you certainly won't.

>Am I just yelling to the breeze? Am I calling upon completely deaf and
>uncaring ears? Am I the only one who is so friggin' tortured by the way
>things have turned out that I desparately want to see a change, regardless
>how impossible that change seems to accomplish?

You're the one who's out of touch. Your ideas are of equally little interest
to both the Atari community and the world at large.

>All it takes is people who know how and are willing to program

Are you one of those? Then program. Put your material up at
http://www.sourceforge.net/. Share with others, when you actually have
something to share.

I tried to do that using STiNG on my Falcon, but couldn't find any software
on the Mac that was friendly enough to allow a direct 'null' connection on
the LAN port. Finally I gave up, and just did null modem via CoNnect and a
Mac terminal program (Z-Term), for file transfer. IP masq etc would have
been nicer...

Actually, if one could live with DOS for a while it should be possible to adapt an emulator like PacifiST to work with FreeMiNT and fVDI. The problem with current MiNT-kernels (IIRC) is that the new, built-in FATFS only works on "real" hardware, so fixing that (preferably in the emulator) should be the first thing to do. Then one must implement a PCIBIOS and (possibly) adapt fVDI's Mach64-driver, and adapt GSXB's Soundblaster-driver. I guess a real harddisk-driver must be implemented as well. Then it would be possible to minimize the emulation of hardware.

FreeMiNT already works with DOS-compatible FAT16 and FAT32 partitions, as well as VFAT. It also supports minixfs and ext2, so it would integrate very well with other operating systems on the PC without actually *needing* any of them.

> Would the people that maintain and develop MiNT be interested in such
a feat?

I don't think they're emulator-fans (neither am I, but what can you do when you need (want) faster hardware...).

I've tried this with GEMulator, which unfortunately only worked in monochrome and didn't use any accelerated graphics. A real VDI-driver would do wonders for most emulators. This is also something Johan Klockars (author of fVDI) seems to be interested in.

Highly irrational, but so is using Ataris in the first place so I think
I understand you ;-) However, when we start using emulators I would
rather use fast, cheap hardware I can buy in any local computer store
than having to import expensive hardware from Germany.

So this is a problem on Macs as well? I had lots of problems with this
on the PC (Win98) as well, I ended up in writing a "modem emulator"-
script for chat and fooled the PC to believe that my Falcon was a
modem... I don't know if something like chat exists for STiNG though.

I don't think that it is trivial to design a GEM system that way,
because of the way VDI workstations are used by applications. Maybe it
is possible to solve with some dirty tricks, though.

> [2] Under raw console-mode Linux, perhaps via the framebuffer, as a
> low-resource graphical system with much less complexity than X.

This is the way OSIS, or ovdisis actually, works. It works with the
framebuffer and GGI, although the GGI part supports less than the fb
part.

I am sure you're right. I don't know much about the technical underpinnings of GEM.

One possible way is the way WinNT runs 16-bit Windows applications. The new, 32-bit Windows kernel is not binary-compatible with the 16-bit one. So, 16-bit apps can't run directly under it.

Instead, there is a translation layer called WOW.EXE: stands for Windows-on-Windows. It "thunks" 16-bit calls through to 32-bit calls to the kernel, and translates the results back. 16-bit code runs on WOW, WOW runs on the 32-bit kernel.

The great advantage of this is that you can run several copies of WOW at once, and each 16-bit application thinks it's the only one. Programs that cannot or do not multitask under 16-bit Windows, or Windows 95/98/ME (which still has a partly 16-bit kernel), can multitask happily and safely on NT.

So the "big" native GEM system - call it X-GEM for the sake of argument - can be totally incompatible with old applications. As long as the APIs remain similar enough for source code to be recompiled, perhaps with some global redefines, that's OK.

X-GEM but runs a stub that presents the old API to old GEM applications so that they can run under the new environment.

4251. Atari Software for sale..

Newsgroup: comp.sys.atari.st
Date: 2000-10-19 00:00:00 UTC
From: JonOUTathan.whFORite@mSPAMcc.ac.uk
Message-ID: <8FD28C4ECJonathanWhitemccacuk@news.mcc.ac.uk>
Source record: 55984

Hi all..

I'm a former ST/Falcon owner. Recently I found a box full of software in my attic and rather than throw it all away, I thought I'd offer it for sale here. All of it is proper, bought and paid for software with manuals. Some of it has suffered a bit from being in the attic in terms of the maunals being a bit damp, but it all looks in OK condition to me. But here's the key - I have no way of testing any of this stuff to make sure if the disks are OK. This is why I'm selling it dirt cheap, because I don't honestly know if it will all work or not.

Price is dead simple. Each 'thing' is a fiver, plus the postage required to get it to you. I'm in Manchester, UK, by the way.

As follows..

Apps

Papyrus Gold
WordFlair II
Calligrapher Gold V3
Hisoft Truepaint
Hisoft C Interpreter

NVDI
SpeedoGDOS (plus some extra disks of fonts)
Ease Desktop

Games

Speedball II
Gods
Mangetic Scrolls Collection
Wonderland (Magnetic Scrolls adventure game)
Corporation + Mission Disk
StarGlider II
Elf

Book

Abacus Gem Programmers Reference

Contact me via email or leave a reply here and I'll get in touch with you.

This is not correct. MagiC can also access clusters with more than 2
sectors.
But this doesn't change anything with respect to the partition sizes
since the maximum number of bytes per cluster is limited for TOS
compatible partitions.

MagiC can. You can get all this information with the "GEMDOS limits"
function in HDDRUTIL.

Now, in this house, emulation is so out of the question that I can't find words for it. I mean, I would go to Germany, steal the TOS sources from Michael Schwingen and port TOS/MiNT/Xaaes to a PPC thingy before I even consider emulating :) Ofcourse, to run old Atari apps, a m68k emulator would have to take care of that, but the OS would run native.

It's not even certain that any bars show up, it depends on the
TOS version. AFAIK version 2.05 installed in some MegaSTe's doesn't
show any bars when booting. However it does perform the memory test.

Take care,

I'm attempting to run a BBS on my Atari ST using Transcendence BBS (I think it's version 2.401)
The problem is, my BBS thinks that it's 1900, not 2000. I am on an Atari 1040STfm, running TOS 1.06 (I think, I know it's a pre 1.4 version) ...
And I have downloaded and installed the Y2K patches mentioned on the http://quickfaq.atari.org ... they patch the system ok but my BBS still insists that it's 1900! Is there any way to fix this problem?

I agree, it doesn't matter what newsgroups you go on there are always trolls, it's a fact of life/the net. I've only been on this group for about 2.5 years and it's a lot better than the others I've been on even allowing for S....p.

Moderators, however hard they try will never please all of the people all of the time and the last thing this group needs is people leaving because they feel of a form of censorship is being applied, the number of postings are naturally less now than they used to be as owner/usership degrades.

In the 70's and 80's I worked on ICL mainframes.
Half way they invented a completely new range ans completely new OS.
The new hardware had a very fast cpu core. (O.K. for that time.)
Actually the new cpu was loaded with a microcode.
There were 2 microcodes available.

Guess why?

:-)

The STE TOS does not have "memory test" and "server delay" bars on
startup. These are features of TOS 2.06, 3.06 and 4.x. The STE has 1.6
or 1.62, although 2.06 could be retrofitted to the STE.

The Mega STE came with TOS versions 2.01, 2.05 or 2.06. Only those
fitted with 2.06 had a visible memtest/delay on startup.

Likewise, TTs came with TOS versions 3.01, 3.05 or 3.06. Only those with
3.06 had a visible memtest/delay on startup.

Yes, it does run several (emulated) applications under linuxppc but
not that many under linuxx86. For native applications it works better,
but there are not many native applications.

```
Hi,

I have written a piece of code that looks like :

JumpFrom:
jmp ([JumpTable-JumpFrom-4.b,PC,d0.l*4])
JumpTable:
dc.l Target1,Target2,...

Target1: some code
Target2: some more code
...

The advantage is that it doesn't need an extra address
register and is faster than any other method I tried.
When I assemble it with the Pure Assembler it works very
fine but when I assemble it with DevPac 3.10 although I
set the option to 68040 and in the DevPac manual it is
described to be working from 68020 up I always get :

Error : relative addressing not allowed

I tried every variation I could imagine but it's no use.
Unfortunately I need GST format output of that module
and therefore can't use the Pure Assembler.

So can anybody tell me how to write that code so DevPac
accepts it or is there a bug in DevPac preventing the
use of PC relative addressing modes ?

Thanks
Gerhard

So basically you want to end the "Atari"-life with the 060. If you want
something faster you *need* an emulator. For some strange reason it seems
like an expensive and slow "clone" with a PPC is more politically correct
among many, even though it's still the same as a PC - a different
architecture with an emulator. It's just slower, more expensive and harder
to get.

Please do that, but I'd prefer if you port it to something *I* can afford
;-) A PC.

> consider emulating :) Ofcourse, to run old Atari apps, a m68k emulator
> would have to take care of that, but the OS would run native.

There's nothing that keeps you from porting the OS to x86 as well, but
running it under the 68k-emulator is the fastest way to get it going. When
it comes to the point where it's fast, stable and usable, it's time to
start porting the drivers, OS and apps to the new CPU. Just like Apple did
it, if you exclude the "fast, stable and usable"-bit.

Not in this case. You can walk into any computers store here in Norway and
compare prices and performance, Macs *are* underpowered and overpriced
compared to PC's. They tend to look a little better though, but inside
they're just PC's with a different CPU and generally lesser hardware.

hi,
was there ever a port of DOOM or Wolfenstein 3D to the ST/TT/Falcon??
I want some top class 3D shoot-em-ups for my TT

cheers,
Marc

Hello, I just thought I'd quick post this message if anyone is interested. We have the HOLY GRAIL of Atari 2600 carts CHASE THE CHUCK WAGON available for sale. If anyone is interested then check out the auction at the following link
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=470393071

There's an image of the cart and it's in perfect working order. Email me if you have any questions.

certainly, subject to the limitation of the physical size of the drive.
just terminate it.

> of the older 48Mb one. Also, is it possible to connect my old SCSI
> CD-Writer to the TT?

you'll probably want to use the external SCSI port, so you'll need
cabling,
power supply, maybe a box to hold it in, and termination.

Hi,
If it's one of those devices that's plugged into the serial port, you
should be able to use the "Export" driver that's included with Cubase
from the start. Just make sure it's in the MROS folder and rename it
from export.dr to export.drv and you'll be in business :)

>to get.

I don't want to end it's life at all. But the current obvious upgrade line would end at the 060. That's not being unrealistic, that's fact. The ST-type platform, was 68k. Do you deny this? Or are you denying that the 060 is the top of the line 68k?

Now, if we don't want it to die, it means moving to another cpu... to me, there is no such thing really. A cpu is central to the platform, no macs could be macs if they ran on a x86... they'd be "Apple PCs" (also, hell would be quite chilly about then, if I know Jobs). No amigas would be REAL amigas, if they were running on alpha chips (though, it would prolly kick ass, all the same). If you do concede that the cpu is unimportant, then every emulator is exactly the same as the machine itself, in a philosophical sort of way. Bullshit. The platform is a family of computer systems that all have a CPU family, rom, bus architecture, and OS in common. In this sense, it is the PC which is a blurry freak, with little definition. How many different expansion busses have they had over the years?

So that leaves us with a dilema. If we don't want it to die, we need a new cpu. But with a new cpu, it's not an ST. I however, feel that there is a new cpu, that still belongs to the same clan, if not family. The PPC is the only real option. And it's more than just the same manufacturer (In some cases, it's not even the same manufacturer... IBM makes ppc's too). Why can I claim that it's of the same family, if a bit more distant? For one, continuity... even as the 68k line was ending, the PPC was coming into it's own. If they were concurrent for a great length of time, for instance, if the 68000 and 601 were designed in the same year, but after 68060 was gone, the G5 comes out... well, obviously, they can't be the same family. This isn't the case, and we have continuity. Second, we have a cpu architecture, that if not compatible, you can at least agree that is more similar than any other two random chips. Try to run DOS 2.0 on a pIII... yet we'd all agree that the 286 and pentium3 belong in the same family. Third, if a straight port were done, it would be easiest to the PPC than to any other. Fourth, there is precedence. Apple's transition, the Amiga PPC accelerators (even rumors that they would have moved to it, had it not died), and I've even heard people say that the ST series either has or did have at one time, a PPC accelerator or maybe it was a clone.

Now, if you still want to emulate, go right ahead. Just don't pretend that it's an atari, and then come bitching to me that I'm not pretending along with you.

John

By that logic there are no "real" Macs today - because none of them has a
68k.

ISA, VESA, PCI, AGP and that IBM-thing that never caught on. On the Atari
we've had four or five incompatible expansion busses during the same
period. And how much does the TT have in common with the ST? It's a *very*
different design, something the pretty crap compatibility (when it comes
to games and demos) shows.

68060: available as pulls (spares from industrial and
other machines being upgraded to newer processors).
Sourcing the CPU might have been a problem for
several hundred thousand users, but not for the few
die-hards left who are still willing to spend on their
hobby.

Everything else is off-the-shelf PC stuff, and production
model PCBs for anything have to be custom-made in
any case so there are thousands of companies that can
handle that aspect.

If there are any hardware-related problems, they'll
be to do with the actual design of proprietary system
logic circuits (which are implemented either in widely
available programmable gate array "blank" chips or in
custom silicon by any one of many companies, in a
similar fashion to the PCB), not getting hold of parts.

And it's my fault you're too dense to see the difference between 'model' and 'platform' or for that matter, between 'atari emulator' and 'atari platform'. You bring up stupid little comments about various model incompatibilites, and act as if that makes any difference? Come on. Incompatibilities are a GIVEN (you can only hope that they are few and mild), the alternative being that you only ever have a single model of computer. Wow. A one model platform, we all love those, do we not?

I tell you what. Why don't you reverse engineer the 060, and design the new 080 cpu, for use in ataris. I'll spring for the ASIC die, if you come up with a decent design (I'll even forgive a few FOOF intel style flaws, after all you're only amateur) Maybe the amiga community will chip in... no, wait. Um, they've all moved on to the PPC! I wonder why? Could it be that it's the sucessor and true heir to the 68k? Could it be that we are talking minimal opcode translation or virtual registers? Grow up. 68k and PPC might be cousins, instead of father/son, but that doesn't mean that the x86 and 68k are brothers. What you want, is a cheap computer, not a good one. And on top of that, a cheap computer that has an OS and/or emulator that can make you feel nostalgic. *puke* That's fine and dandy, but give me the real thing any day.

4297. Re: Neotari Corp. brings us the Phoenix!!!

Newsgroup: comp.sys.atari.st
Date: 2000-10-20 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <39f0ad90$1_3@athena.netset.com>
Source record: 56032

I just wanted to interject some sanity back into this argument as
it seems to be digenerating...

I personally am in favor of a PowerPC port. But that's me. No
logic behind it, no real reason, maybe the fact that it was made by the
same manufacturer as the CPU in my TT. However lets look at all this
logically a bit.

1. There is no reason that an open setup could not be ported to
both architectures. There seem to be enough people interested in both
options to make either and or both viable. Linux does it, BSD does it, Be
does it (or at least did) no reason we can't.

2. PowerPC option does have some problems.

Open PPC boards have never materialized, IBM didnt bother to
make North/South bridge chips in quantity. These leaves 3
options. 1. Hire a company to manufacture boards (someone else did this
and the price rance was around $800 per board) 2. Try to work out (or in
the case of a clone try to get) the real lowel functioning of the hardware
to a Mac motherboard (clones preferably as these go fairly cheaply since
Apple cut them off) 3. Go with some sort of embedded SBC option. Again
this last isn't very inexpensive.

3. x86 does have some positive points.

Even a really good modern motherboard tops out in the $600 range.
Some things would be a bit easier to port (x86 ASM in some open
source games).

So I would suggest the following. Instead of fighting over which
is better and who is insane. IF we ever get to the point where this idea
is more than just the desires and rambling of us in the community, why
don't we make them supportive projects instead of competive. Why not set
certain standards and keep them? Options to choose your own hardware and
change that option could be nothing but positive.

I would also like to propose one new standard for our dream open
source 'atari' OS. Begining of the executable has some flag that depicts
what hardware architecture it was compiled for.

Still personally dreaming of a PPC atari clone ;)

Dan Ackerman

The only continuity by MAC is the operating system. The hardware is completely
different. Apple have used a 68K emualator for years. They seem to have done
the job so well, that only a few noticed. You were not one of those.

> Now, if you still want to emulate, go right ahead. Just don't pretend that

We dont care that much, but you dont want to emulate, but you'll have to if
you want your PPC. :^)

Hmm. Looking through the files that ended up on my drive revealed two files
of message headers, each header with a line mentioning that message bodies
should be downloaded seperately. The cascading menu entry for
comp.sys.atari.st just brought a blank window with 0/0 messages...

Perhaps I didn't configure it right, but there doesn't seem to be much that
can go wrong (bearing in mind that it isn't being run under MiNT, though
that shouldn't make a difference I'd have thought).

Okay, hopefully someone knows this...

Does anyone know who composed the "Have You Played Atari Today?" ditty?

And on a less difficult note (groan), what's the name of that classical song
Atari used for a lot of their TV ads back in the 80s?

Hello All:

Go to:

http://www.mboom.com/free/atari.html

For a FREE Cubase-Like Sequencer for Atari.Has lots of features and is so VERY Cubase-like it is scary! Plus some tricks that Cubase does not have.

Needs one meg and a monochrome monitor or Color with Sebra.

Announced today on Atari-Midi Egrp by Guido.

Would appreciate any comments

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Now, that logic is strange to me, Jo Even. Don't you just call all x86
machines a "PC"? You dont call all machines with a PPC a Mac? Amiga's have
PPC cards, PPC machines are called by their brand names, not some common,
faceless name like "PC". A PPC based Atari machine would still be an
Atari, while a PC emulating Atari OS would still be a boring PC. Not
acceptable to me at all!

Hehe, you're a religious person, only you deny it :) No person modifying
his Atari machines like you do is "not religous". And come on, I know deep

down you also agree that a G5 based machine running TOS/MiNT natively
would be so much cooler than emulating something on a faceless "PC" ;-)

Hmm.. who was that someone else that hired a company to manufacture
boards? If someone designed a board for us to port our OS onto (PPC based,
ofcourse), I would gladly pay around $800 for such a thing. This would
include the great, great benefit of knowing all there is to know about the
hardware! That would certainly be the best way to keep the "Atari
personality" ;-) Rodolphe, are you reading?

So.. anyone still into Atari have the skills to design such a thing? Not
asking for it to be done or anything, just curious. I don't have hardware
skills like that, just to point that out :)

Hi!

I've e-mailed the maintainer of WinSTon, offering to help with MIDI support for Windows, but never got a response. So I'm posting here to see if anyone wants my help or knows where I can offer to support Winston, and I'm also posting to ask for anyone who knows about the Atari ST side of things MIDI-wise (because I only know about programming MIDI under Windows, hardware and software (ie, which port is to beemulated)..

Hope that's clear enough!

Jeremy.

> are brothers. What you want, is a cheap computer, not a good one. And on top

Where have I stated that the x86 is "closer" to the 68k than the PPC? The
point is: Whatever CPU you choose to replace the 68k-line, you have to
emulate the 68k. Period. You can argue for and against emulation, and I
completely agree that emulation isn't the ideal way to run apps or
operating systems, but when you talk about "the true heir to the
68k" you're simply talking about emotions.

> of that, a cheap computer that has an OS and/or emulator that can make you
> feel nostalgic. *puke*

That's just insulting. Take a look at
http://atari.nvg.org/my_computers.html and then tell me that I'm just a
nostalgic sucker. I want faster hardware for one simple reason - the OS
and apps is getting more and more complex and needs more CPU. It's that
simple.

Please feel free to design a new platform with a PPC, but don't pretend
that it will be any better than a x86-based solution. It's
just... different. And more expensive. And probably a lot slower. And
certainly almost impossible to buy. Not to mention repair within
reasonable time.

Hi Jeremy

Thanks for your OFFER and I hope someone listens as this is DEARLY NEEDED to be able to run Atari Midi Apps on a PC (under emulation of course) There are some Atari-Midi apps that cannot be reproduced for Windows like Dr T's KSC Omega II with PVG.

I am just Encouraging you and anybody here that does Atari Emulation for PC, that this is a need.

BTW...for the Mac platform, I am happy to report that NoSTalgia DOES work for Midi. You really have to "tweak it" though.Harry Koopman (Of Midijoy) has tested it for us on Atari-Midi Egrp.

Why? Are there any technological reasons? Price
vs. performance? Availability? Or just the fact that it's made by
Motorola?

> Now, that logic is strange to me, Jo Even. Don't you just call all x86
> machines a "PC"? You dont call all machines with a PPC a Mac? Amiga's have

Read closer what I was commenting on - **** said that "no macs could be
macs if they ran on a x86". Why is it so? Macs originally used 68k, then
they switched to PPC. Why are these Macs "real" Macs, if a
x86-"Mac" couldn't be? If Apple suddenly decided that x86 was cheaper and
performed better, and switched from PPC to x86 the same way they switched
from 68k to PPC, wouldn't they still be making Macs? ****'s logic doesn't
make sense.

> PPC cards, PPC machines are called by their brand names, not some common,
> faceless name like "PC". A PPC based Atari machine would still be an
> Atari, while a PC emulating Atari OS would still be a boring PC. Not
> acceptable to me at all!

Highly biased... First you have "PPC-based Atari machine", and then you
have a "PC emulating Atari OS". The fact is - whether you like it or not -
is that both options will be very similar. The "PPC-based Atari
machine" won't be an Atari, because it's not manufactured by Atari. And it
will use a 68k-emulator. Using standard PC-technology won't be any
different, except the choice of CPU. How much of the OS or apps you want
to run under the emulator does not depend on the choice of hardware, but
on how much work you want to put into the software initially. Look at what
Apple did - they started with PPC-based machines which ran almost
everything - including most of the OS - under the emulator, and it has
now evolved into a machine which finally doesn't include a 68k-emulator at
all.

I know that you like to program in 68k assembler, if you want to continue
with assembly and still have fun you don't have a choice but run your
software under a 68k-emulator. x86-assembler might be dreadfull, but
PPC-assembly isn't any better...

>> This is religion, and since I'm not a religious person at all I won't
>> discuss this further.

> Hehe, you're a religious person, only you deny it :) No person modifying
> his Atari machines like you do is "not religous". And come on, I know deep

Good point ;-) But all my modifications have had one purpose - better performance. I can't get any further with the current hardware, so the next logical step is - you guessed it - something radically faster.

> down you also agree that a G5 based machine running TOS/MiNT natively
> would be so much cooler than emulating something on a faceless "PC" ;-)

To me they're all the same, PPC, G5 or whatever it will be called in 2009 when the first PPC-based "Atari" arrives are just as anonymous and "faceless" as a x86. I don't like Macs, they're just PC-technology with a more expensive CPU, cooler case and a extremely boring, fascist OS. PCs are boring too, but they're a lot cheaper and faster.

And most importantly, I'm sick and tired of waiting for the next superfast clone. I want something *now*. Something that works, and is fast. And which I can buy tomorrow in a local store if I want.

40%?? Do your homework...

> emulating 95% of the atari system. And as the API would evolve/grow to fit

Who's talking about emulating "95% of the atari system"? I'm talking about booting a PC directly into a 68k-emulator, not a ST-emulator. One would still have to write drivers for all the hardware, and *not* emulate old hardware to satisfy the OS. I'm basically talking about a Milan with a x86 instead of a 040 or 060. If you want to you can design a new, PPC-based machine and do the exact same thing. But it will take ages before you can release something like this.

> Emulators are a dead end. Since they only pretend to be an atari, they can't
> be anything more than the latest atari out there. A new atari, provided it
> really is one (and clones count), can be whatever the designer can dream of
> and afford to produce.

You obviously haven't understood what I'm talking about. I wouldn't even raise this discussion if I wanted a ST-emulator, because we already have quite a few of those. And don't want an emulator that runs under a different OS (like MagiC-PC, TOSbox or GEMulator does) because we already have quite a few of those as well.

I don't know why we are arging about this. Why can't we just follow Apple's and Amiga's footsteps with PPC? They are both doing well. If we were to switch to x86 the mobo would have to be built specifically for a TOS clone. I would not accept a PC motherboard with an emulator. I think Tempest is the best idea anyone has come up with for a long time. CT060 is fine and dandy but allready obsolete as was the CT2 when it came out.

NoSTalgia supports Midi via Quicktime (Midi OUT) or OMS (Midi IN & OUT)
but some applications are not (yet) working.
Note that the current version of NoSTalgia (0.7) has a bug preventing
Midi apps to run.
Version 0.71 is planned next week.

Enjoy !

If we are talking actually designing and making new hardware, PPC vs x86 should roughly be price comparable. At which point, PPC wins my vote. And it's not just emotions, literally, there is less need for emulation than there would be for the x86. Internally, the cpu is not a 68k for sure, but it's a helluva lot closer to it than an intel chip ever could be. Minimal opcode translation, minimal need for virtual registers, and no more need to emulate the memory/address map than we would for x86, maybe a bit less.

If we are talking running an atari emulator on your dirt cheap dell... go ahead. No one here is stopping you.

John

They would be Apple branded PC's. They would not be a mac, as while any definition of a platform can be fuzzy, it's clear on that point. Apple might instead actually write an OS for it, and if it can't run windows or other x86 OSs, then it would be a second platform based on x86. Still not a mac though.

Example: SGI has been trying to sell a new line of x86 NT computers, as lower end workstations, I believe. Would you actually claim that these belong in the SGI platform?

Manufacturer.
Platform.
Model.
CPU.

A platform doesn't necessarily mean the same thing as the platform, nor does it the model. In this way, a 486 model might still be x86, even though a 286 is x86 also. A Umax mac clone is still the mac platform, even though not made by Apple. An atari does not belong to the Amiga platform, even though both use 68k. It's pretty simple, if you ask me. Granted, there are some fuzzy boundaries, but not this time.

John

Definition of "emulation" can be very... well.. flexible. One might even
argue, for example, that Atari ST is emulated on a Falcon. People might
not be too fond of emulation concept, but if they are realistic they see
that all "real" Atari hardware items are slowly dying of old age and
building complete new Atari machines within acceptable price seems improbable.

You know of Turing's machine-inteligence test: suppose that you can
communicate with some entity by means of, say, a keyboard and screen/printer,
or some such device that removes unimportant details like voice coloration,
and if you can have an extensive discussion with this entity without
being able to say whether it is human or not, it would be unintelligent
to deny that entity the capacity of intelligence.

So imagine something similar: if you were given a monitor, a keyboard
and a mouse to work on a hidden computer, and the screen, the OS, and the
applications are those of an Atari and you can't tell whether the computer
is really an Atari or not (except, perhaps, by its speed), then why refuse
to admit that this machine is an Atari?

>Perhaps Gemulator can run newer MiNT versions? There is a free version.

I did try it. Overall effect is similar to TOSBox, but with the burden of
having to wait for ages while WinNT loads while TOSBox starts with DOS
almost instantly. Some things that work in TOSBox did not work in Gemulator
and vice versa, e.g:
* I could not start MiNT+ AES 4.1 in Gemulator and it worked in TOSBox-
in Gemulator I had "Corrupted AES" message- but I heard from a guy who had
WinNT with a newer service pack that this MultiTOS worked or him.
* Zmodem (GSZRZ) worked properly with a terminal-emulation program in
Gemulator, but refused to do so in TOSBox
* Prospero FORTRAN compiler and compiled FORTRAN programs worked in
Gemulator but not in TOSBox.
* DynaCADD worked (for a couple of minutes, until it froze) in TOSBox
and not at all in Gemulator (it worked in PaCifiST).
* Jinnee (demo) didn't like Gemulator and all sorts of improper behaviour
happened until if finally crashed. In TOSBox it worked almost OK (I could
not avoid lowercase filenames appearing in windows and file selectors with
MiNT installed, which sometimes made problems with file masks and file
search). Overall it's a nice desktop and it's a pity I don't have a full
version.
* New MiNT versions with built-in file system refuse to work in any emulator.
* Gemulator seems to have several unpleasant quirks (bugs, that is).

So, everything is.. almost, but not quite.. there. It seems to me that just
a little has to be done to make things work almost perfectly. Only, there
is noone to do it :(...TOSbox development has ceased.

>If not, I can prepare a XaAES version that runs on MiNT 1.12

I tried it a couple of weeks ago on my Mega, but had a lot of problems-
beginning with a fact that I could not start it (properly?) from MINT.CNF
(GEM=...), but only from desktop. Then there were problems with repeated or
incomplete screen redraws, some programs crashing, etc. And also Megapaint,
which, for some reason, I like and use very much, can't work. It doesn't
work with AES4.1, and it doesn't work with N.AES (a friend told me) but it
works OK with Geneva and Magic which can launch it in "singletask" mode
(can "singletask" launch be done somehow in MiNT? If not, I consider it
a serious flaw).

I am aware that XaAES is still in development, so I don't complain much.

>If I remember well, I must have a 500MHz pentium somewhere around. :-)

I tried all this on a 450MHz/Pentium II Compaq with WinNT at work.
Unfortunately, I could not tested everything very systematically- I could
hardly devote a couple of days to playing with Atari emulation. And it seems
that this particular PC is a little odd- a lot of things seem to be embedded
in the motherboard and I have noticed occasional minor differences
in behaviour, referring to other PCs.

Somehow I did not succeed running NVDI, MiNT, etc. on PaCifiST, contrary
to TOSBox and Gemulator where they worked fine.

>problem with current MiNT-kernels (IIRC) is that the new, built-in
>FATFS only works on "real" hardware, so fixing that (preferably in the

I think this is the case- if I remember correctly, only old MiNTs without
file-systems worked when I tried them with these emulators.

>Then one must implement a
>PCIBIOS and (possibly) adapt fVDI's Mach64-driver, and adapt GSXB's

Sounds reasonable...

>> Would the people that maintain and develop MiNT be interested
>
>I don't think they're emulator-fans (neither am I, but what can you do
>when you need (want) faster hardware...).

True. Although it is debatable whether this would be an emulation or
a sensible way to make a high-performance Atari computer.

>> For fun, I have tried setting up an autostarting multitasking
>environment in TOSBox on an average PC:

>I've tried this with GEMulator, which unfortunately only worked in
>monochrome and didn't use any accelerated graphics.

Well mine was monochrome too- TOSBox and Gemulator can be set up to Atari's
16-colour mode, but I don't consider this as serious colour mode and there
seem to be occasional problems with font sizes.

>A real VDI-driver would do wonders for most emulators. This is also
something Johan Klockars (author of fVDI) seems to be interested in.

Magic PC also has a "real" VDI driver, doesn't it?
I think that someone said that it really improves speed very much.

Another thing that I would like VERY much to see in an emulated (or
however it shoulkd be called) Atari machine is FPU support- preferrably with
a choice of memory-mapped or line-F FPU. Floating-point calculations seem
to be the weakest point, speedwise, of all Atari emulators.

May I suggest that documentation for absolute beginners be packed into
a simpler and more common archive format (zip?). I can unpack this,
but those who want to know the most basic things about MiNT may not be
familiar with tar and gzip.

Wasn't GEM written for the xx86 system, Amstrad (a UK company) shipped it with its PCs? ;-) Furthermore weren't some of the early fonts for the Atari were straight copies of PC ones, ie arse about face (as is typical with PCs) in that they were written low byte-high byte order. All the operating systems seem to have bits copied/purloined from other systems. Still the xx86 series do seem particulary convoluted in their workings, or perhaps it's users expecting to use more than 640K of memory.

The first thing that strikes me here is that your offset calculation has
a trailing ".b", which Devpac thinks means "byte". This '020+ addressing
mode only allows word and longword offsets.

Also, why don't you use "jmp ([JumpTable,pc,d0.l*4])" ?

AFAICR, it is analagous to
lea JumpTable(pc,d0.l*4),a0
jmp (a0)

I haven't used that addressing mode very often in the 8-odd years I've
owned a TT

Emulating 40% of the 68k cpu core, is not quite the same magnitude of emulating 95% of the atari system. And as the API would evolve/grow to fit the new system, it wouldn't remain at 40%. Macintosh doesn't emulate nearly as much as it had to for the first powermac. The emulator 'software' will still be emulating as much 1000 years from now, as it did today. Heh, if the emulator authors have their way, it would prolly emulate more, not less. Emulators are a dead end. Since they only pretend to be an atari, they can't be anything more than the latest atari out there. A new atari, provided it really is one (and clones count), can be whatever the designer can dream of and afford to produce.

No comment on Linux or BSD. Beos did it because they were too lame to realize they had designed and made a kickass machine. One of those most amazing platforms yet, and only 1800 beboxes built. If you want to turn what little bit of the atari is left, into some lame-ass OS ala OS/2 Amiga DE.... count me out.

>this last isn't very inexpensive.

Assuming we keep it simple, we might be able to get away with a smaller 6 layer board. Not cheap by any means, but more like $75 instead of $800. Would have to minimize surface mount, or least socket it. That will get harder to do, with each passing year, as the variety of through hole components decreases. This would be one hell of a hand solder job, even for me. Definitely not a beginners kit.

> 3. x86 does have some positive points.
>
> Even a really good modern motherboard tops out in the $600 range.
> Some things would be a bit easier to port (x86 ASM in some open
>source games).

At which point, all that is left of atari, is the 10,000th x86 OS. Not to mention, as bad as the other ones are, this one would by nature include a kludgy emulation layer, and only provide the a fraction of the power of an alien aging platform. Hey, this has microsoft killer written all over it.

> So I would suggest the following. Instead of fighting over which

I've seen it said a few times PPC chips are not necessarily fast,
cheap, and hard to find. Hmm... seems to me it carries on the
tradition of the 060 to some extent. lol

Personally I would not touch a x86 based solution no matter
how fast or cheap it is, call me religious. The amount of legacy
crap in such chips is utterly disgusting and why bring such
baggage to a more refined system.

I would pay out the wazoo for a PPC based solution, if someone
goes that extra mile. I've never gone for cheap, in fact
I've bought upgrades for my Atari's that cost as much as complete
PC's, more than once in the past. ;-)

I share the same PPC dream as others...

No no, they were already twisted.

And now you twist them further.

Unix is a platform that runs on pretty any machine.
That is true.

So you think because of that there cannot be another such platform?

Ah.

You are just an idiot. The reason I've used the word "platform" instead of "OS" was to signify a concept other than that of "OS". Else, we might have been using "OS" all along. That you want to ignore distinctions that everyone else seems unable to ignore, is not my problem.

I tell you what, just to help you avoid tortured mental gymnastics that might be necessary to have a conversation with clueful people, I promise to use the acronym "OS" whenever I'm talking about "OS's", and not the word "platform". Oh wait, I was already doing that to begin with!

Source record: 55799

I've been out of the Atari scene for about 18 months now, but I'm glad to see it's still alive and kicking with new releases of STinG, STiK, and various other major programs.

I'd like to get back into it all, but it's a matter of time etc. But who knows, maybe one day....

However, I am currently in the process of changing ISP's, so my trusty website of www.the-gap.demon.co.uk will no longer exist in a couple of weeks time (it's served me well for the last 6 years!).

My Atari page, which contains all my Atari software such as POPwatch, NEWSwatch, CoSTa, gapFTP etc. can now be found at the following addresses (all point to the same page):

http://gary-priest.atari.org/
http://www.gapcs.fsnet.co.uk/atari/atari.html

Emails should be sent to one of the following addresses:

gary-priest@atari.org
gary@gapcs.co.uk

Apologies to anyone who has emailed me recently and not received a reply. It's just that I've been extremely busy.

Best wishes,
Gary Priest

> personality" ;-) Rodolphe, are you reading?

I read sometimes the NG here !

I think that this discussion is so steril !!
Reading the messages here, it seems that people (like you) who know the
RIORED project are RARE !!
Some of guys here should read my pages !
But YOU know that RIORED is an OPEN PPC machine READY to receive ALL OS !!

The only problem is : WHO will code the atari OS on the PPC(s) of RIORED
???!!
eh ?!
OK, the discussion is CLOSED !

PS: and please don't speak about the Tempest Joke !
After 3 years, did you see a photo of this product ????
NO ! So, no prototype ??, software dev without a proto ???!

>

I personally like the idea of running it on PC hardware. I can't
understand why people are getting mad about this.

I would actually like to have a PC that, when started, booted a
native x86 port of MiNT and have some sort of 68k emulator in MiNT
after startup to take care of anything that needed a 68k to run. I'm
sure someone could write an x86 native VDI and a native AES (how about
XaAES, Henk?) to run after mint was started. There would never be any
PC operating system like DOS or Windows booted at all, MiNT would just
be the operating system on the computer.

Now, granted, I have little programming experience on this level, so I
don't have any idea how difficult it would be to port Mint to a PC to
run as the native OS. Probably possible, though.

I'm not too fond of sitting on my ass and waiting for some new
motherboard to be built with a PPC chip that I'll have to have
imported from Germany. If I'm going to buy hardware for any amount of
money, it damn well better be supported and warrantied by some sort of
company I can reach. And a company with a minuted production run of
custom PPC motherboards most certainly will not provide support.

However, when my trusty PC here breaks down, I just drive over to the
store where I bought it and they fix it. I don't like the thought of
having to mail broken items to europe somewhere.

A native MiNT port on an x86 system would be sweet. In almost every
way. What's not to like? You have cheap hardware that zooms and a
beautiful Atari OS on top. No DOS, no Windows. Maybe the hardware is
faceless and has little personality, but that's only because it's
standard. Is it really a good idea to produce a new non-standard
piece of hardware? I don't think so. Hell, my TT is non-standard
enough to drive me crazy. And who has seen a Milan? It's completely
faceless. It has a different motherboard inside, but everything else
in it is just boring PC equipment, including the case. But it's still
pretty neat!

What it comes down to is we need a solution. And it should be a fast solution. I can't use my TT as a primary computer because it is inferior to my Windows box in almost every way (it does have a laser printer and an enormous hard drive). I can't do my work on my TT 'cause it's way too slow for what I need . Conceptually, I would like to use my Atari as a primary computer, but my aging hardware doesn't cut it.

MiNT-x86 would be a neat idea. Just think about it.

4367. New MyMAIL version (1.17)

Newsgroup: comp.sys.atari.st
Date: 2000-10-22 00:00:00 UTC
From: epkerha@epk.ericsson.se
Message-ID: <8subaqjvm1@newstoo.ericsson.se>
Source record: 55851

```
Hi all !

New version of MyMail (1.17) at my homepage.
http://www2.tripnet.se/~erikhall/programs/mymail.html

[ Major improvements & bugfixes: ]
* General
- A problem with corrupt filenames after fileselection is fixed.
- Please note that the RSC file is updated so you need to
replace the old one when you update.
- Found and removed some old not used code.
- Some minor redesign of icon drawing functions.
- Fixed a bug in the window object handler.
- Problems with long filenames in Magic fixed.
- A fault in the window object handler was causing
wrong window to be topped in some cases.
This is now fixed.
* POP3
- A bug was causing problems with icon update
at download of mails.
* SMTP
- Some minor redesign and cleanup of code.
* Main window
- Improved the searching of text in all mails.
- Redesign of how status icons is redrawn in the main window
this is done to speedup the redraw and gives smaller code.
- The "move bar" look is updated
<> Now is folowing info shown in the "move bar":
1. MyMAIL rev nr.
2. Selected mailbox.
3. Active user account.
<> The texts 'Mailbox:' and 'Account:' is moved out to the help.dat file.
- Fixed a problem with no displayed mails in mailbox in the case of
new mail and if the mailbox was empty before.
- Fixed a problem with realtime redraw at move of the window.
* Editor window
- Now possible to drag links in text editor.
- Improved the way of selection of text at double clicking.
- Fixed a problem with scrolling of text in the editor when pressing enter.
- Fixed a problem with attached mtext.txt file when mail is bigger than
what mymail can display in its editor.
- Improved the history of the mail address fields.
It is now limited to the latest used 256 addresses.
- A fault in position calculation was causing
problems to drag text if the text was scrolled.
```

This is now fixed.
* Vcard edit window
- Changed the view to be only one view and not two as before.
- Total redesign of the code to allow the new type of edit fields.
Now it is possible to have longer text at every field as
the new editfiled type allows editing outside the visible size.
* Filter window
- Changed old editfiled functions to the new type in filter window.
- If filterwindow was open and then the user clicks on
the icon for the filter window again then there was a
system lockup.
This is now fixed.
* Mailing list window
- A fault was found and fixed in the Update of an existing address.
* Queue
- Moved most of the text for alert boxes out from the code into the help.dat file
* Dialer (stik/sting)
- Moved alert texts out to the help.dat file
and removed all not used text strings.
* Built in help window
- Changed from old window handler to new window object handler
but no functional change.
* Mail formating
- Some minor changes to speedup the code
but no functional change.
- Big cleanup of unused variables.

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

Best Regards
Erik Hall

4368. Broadband and Network

Newsgroup: comp.sys.atari.st
Date: 2000-10-22 00:00:00 UTC
From: Mille Babic <atari@ebox.tninet.se>
Message-ID: <972212342-680183AEicMi@ebox.tninet.se>
Source record: 55852

Hi all!

It was a long time ago I wrote down something here at our own area. I am sorry for that.

What I have to say this time could be very important for all of us with Atari originals. It is called broadband and it soon installed in every home here in Sweden and probably everywhere else. There is not way I am going to use my Falcon with the telephone line when I have this very cheep WAN connection in my appartment.

It is time for me to "chop off" the modem and replace it with a ethernet network card. I consider to attach a PC work as a Internet Connection Sharing (ICS) with two network cards and attach my Falcon with a ROM Port Ethernet Adaptor.

The alternative I also consider is to buy a switch with routing capabilities, such as Netgear RT314 or D-Link DI701 and attach it to the broadband cablemodem ethernet port.

This is my plans. You can read a article i wrote for The Swedish Users Association member Magazine Atarimagasinet about broadband and Networks if you are found in the swedish language at http://user.tninet.se/~gcc561r/bredband/index.html
The problems I (or we) have to solve is to give a Atari Original networking ethernet capabilities. The ROM Port Ethernet Cartridge Adaptor is a way to make this possible. What I then have to do is to return to the wonderful STinG and use the Vassilis Papathanssiou ETHER_PA.STX module?

Someone at Application Systems Heidelberg should look forward and reconsider to enhance IConnect somehow to communicate with a ethernet card such as the cartridge adaptor or is there a solution for that, that I missed? I am pleased with the way ASH produced the Internet packages based on IConnect, such as CAB, Emailer, Chatter, Teli, IFusion etc and o.k there is nothing wrong with free Internet software, but...

Someone told me that the cartridge adaptor is only capable of 75-85 kbps? and o.k. its really faster then my modem indeed, therfore I consider to usa a PC as well and it is the only way my ISP supports the system.

To give my 40 MHz Falcon (eXtender) 12 MB RAM with four SCSI-drives, CD-ROM and a SCSI cartridgetape streamer a way to connect to a LAN and WAN as well is a really upgrade for it. It would be very sad if I could not use it with direct Internet at home. I am
sure that it must be some different solutions to make this work.

I am also not the Linuxkind of person that would use MiNT/MiNTnet and GlueSTiK/ext2 My work and efforts is through the Internet and I am the person who wants a stable, defined and ready-to-go computer system. A sort of a install "default" person or a "ASH spokesman" that Peter Rottengatter asked me if I was, a time a go :-)
Is there someone at here that have a soulution to connect a original Atari to direct Internet and can advise me and a couple of my swe friends over here that consider buy this Cartridge Adapter? We are going to use broadband soulutions through Cable-TV, xDSL

and direct ethernet and are very straight to stay and use our Atari computers for the next years as well.

Best Regards

Mille Babic

> it's not just emotions, literally, there is less need for emulation than
> there would be for the x86. Internally, the cpu is not a 68k for sure, but

I completely agree with you on this point, the PPC *is* a better designed
CPU than current x86-CPUs, and you won't have the endian-problems that
you'll get on a x86 once you start sharing data between emulated and
native apps.

There are several problems with this concept though:

1. Who's gonna design and manufacture it?
2. When will it be available?
3. What will it cost, and how to distribute it?
4. What about repairs?

Since we're talking very small numbers here (with a little luck perhaps a
couple of thousand boxes) I can't see how this can compete with already
existing hardware. The only realistic way to use a PPC would be to use
Macs, but they are a lot more expensive and harder to get. Atleast here in
Norway Macs sell very porly to the public, almost all Mac-dealers
specialise in the business-market and price their boxes accordingly.

Why?? They would still run MacOS, they would still be made by Apple, they
would still be expensive and they would still look pretty silly. Please
eplain to me one more time: How could Apple move from 68k -> PPC and still
be making Macs, while they can't move from PPC -> x86 (running the same OS
and apps)? I'm sorry, but you don't make sense at all...

> definition of a platform can be fuzzy, it's clear on that point. Apple might

> x86 OSs, then it would be a second platform based on x86. Still not a mac
> though.

Hmm, since Macs aren't the only "platform" that use the PPC, you can't
call them Macs now either then. You'd have to call them... ehh... PPCs or
something.

> Example: SGI has been trying to sell a new line of x86 NT computers, as

> belong in the SGI platform?

If they run the same OS and the same apps - yes. But this is not the case
with x86 SGIs.

As Henk pointed out, this is a very good explanation of the fact that
platform == OS.

Hi,
Does anyone know anyware i could find out about creating a PC board for the ST or TT using an Intel cpu (386/486) to emulate PC/Intel based applications and maybe for cross development?

cheers,
Marc

You need to get the data sheets for each
product and all the information you need
to work it out yourself will be there. Some
may also have application notes which give
worked examples of basic projects but that's it.

If you mean has anyone devloped a DIY
project, I don't know.

It didn't seem to loose any personality the last time they changed the
CPU... Or when they discarded their own bus (Nubus?) in favour of PCI. Or
when they started using IDE-disks. Or graphics-cards with a x86-BIOS...

> You just dont WANT to understand? Neither Milan's or Hades were
> manufactured by Atari, but I regard those as Atari machines nontheless.

The Milan actually *emulates* hardware, and you still regard it as an
Atari? ;-)

> Okay, they have genuine m68k cpus. Ok, talking about Mac's and how the
> emulation were done on it. What OS did they run their emulatied OS on?
> Answer me that.

It ran under a completely new OS which - since it runs on Macs and in fact
is a new generation of MacOS - was called MacOS.

> not similar to PPC, but ..) and I found it downright easy. But, I'm in the
> process of learning C, so I guess that won't be a prob :)

C?? Ozk using... C? Before you know what's happened you'll start using
that PC you own as well ;-)

> Norway.. are they really slower than cheap PC's? I think you need to get
> quite an expensive PC to match its powers. Unless something happened that
> I didn't catch....

I'll bet quite a lot of money that by the time you can buy a $1000 G5 here
in Norway, you can buy a faster x86 for $700. And the G5-based
"Atari" will still be five years and another $1000 away.

>> And most importantly, I'm sick and tired of waiting for the next superfast
>> clone. I want something *now*. Something that works, and is fast. And
>> which I can buy tomorrow in a local store if I want.

> Seems to me you want to go PC, just that your ..uhhmm... religion (yeh)

I already have a PC. I hate it. Or to be more precise, I hate Windows. I'm using it for three things only:

1. Dreamweaver/Fireworks.
2. Web-surfing.
3. Watching DVDs.

It only cost me $400, I can live with that.

>YOu shouldn't have too much trouble with the serial ports, as AFAIK midi
>doesn't use a high frequency:)

AFAIK MIDI uses a conection speed of around 32k supplied by one of the ACIA chips. The stock MFP can only go to 19.2k which I suppose can cause problems with midi adaptors connected to the serial port, when lots of data is flowing.

Having RSVE doesn't make the serial port unstable, especially at 32k so having the RSVE should improve matters when using the serial port for MIDI.

Hi Derryck,

Just checked with STIK 2 and STinG 1.26 doc's and can't find any
mention of CHAP support, but I'm sure there is a way. I remember
hearing it from somewhere.

Well I suppose you knew that anyway.

> Somehow I did not succeed running NVDI, MiNT, etc. on PaCifiST, contrary
> to TOSBox and Gemulator where they worked fine.

I know, that's why PaCifiST must be modified. The 68k-emulator seems to be working pretty well, but it doesn't make sense to emulate the other hardware when running "real" apps. When using a "real" VDI and "real" device-drivers one could eliminate all hardware-emulation except the MFP (accessed by a lot of software, also emulated in hardware on the Milan).

> I think this is the case- if I remember correctly, only old MiNTs without
> file-systems worked when I tried them with these emulators.

One must use a XHDI-compatible harddisk-driver. Then MiNT can access all partitions directly, and not via an underlying OS or an image like with current emulators.

>>I don't think they're emulator-fans (neither am I, but what can you do
>>when you need (want) faster hardware...).

> True. Although it is debatable whether this would be an emulation or
> a sensible way to make a high-performance Atari computer.

Exactly my point :-)

> Magic PC also has a "real" VDI driver, doesn't it?

No, you must buy NVDI5 for that.

> I think that someone said that it really improves speed very much.

It does. But MagiC-PC has serious short-comings in other areas which makes it virtually unusable. E.g. it only runs under Windows...

> Another thing that I would like VERY much to see in an emulated (or
> however it shoulkd be called) Atari machine is FPU support- preferrably with
> a choice of memory-mapped or line-F FPU. Floating-point calculations seem
> to be the weakest point, speedwise, of all Atari emulators.

That shouldn't be difficult to implement, although I really can't say as I've never made an emulator myself ;-) But even more important than FPU is the PMMU, atleast if you want to run the OS on the 68k-emulator. If the OS is ported the PMMU is not needed ofcourse.

> I'm after a 16-bit sampler, such as the Stereo Replay's Pro version (not
> sure of the details, just know that my Stereo Replay is only 8-bit),

The 16-bit stereo sampler from AVR was a
fairly high-end product coming in a carry case
and having its own power supply. Cost about
£350 when new.

I suspect you may be after the cheaper mono
version, Replay 16. This also plugs in the
cartridge port, but you have to be aware that
it's a large L-shaped thing which obstructs
the enhanced joystick ports on the left-side of
520/1040 STE machines, and clashes with
the keyboard socket of Mega series machines.
It has MIDI trigger capabilities.

Replay 16 is available from System Solutions.
sales@system-solutions.co.uk, brand-new,
I think about £99.

> and/or a more advanced MIDI system. I've seen STs with cartridges that
> presumably add MIDI ports, as well as Serial based solutions (I'd rather
> not go that route, since I don't know how stable my serial port is -
> it's been RSVEd).

Forget the serial-based solutions, lousy timing.
If you're using Cubase, you'll be in luck.
System Solutions also has the excellent
SoundPool MO 4. Gives 4 extra outputs,
all with the same timing quality of the Atari,
and plugs in the parallel port. Very solidly
built in a metal case and ultra reliable.

I know you said "swap" but this might be
useful in the event you don't get what you
want for what you're offering.

OK, Apple is doing fairly well but Amiga?

> switch to x86 the mobo would have to be built specifically for a TOS clone.

No, the entire point is to use existing hardware. I.e. no hardware has to
be built explicitly for this, that's the entire point in using a x86. If
you want to build a new motherboard you can use a Coldfire and get away
with very little emulation.

> I would not accept a PC motherboard with an emulator. I think Tempest is the

Tempest: PPC-card with a new microkernel that loads a 68k-emulator.
Everything, including the OS, runs on the emulator...

> best idea anyone has come up with for a long time. CT060 is fine and dandy
> but allready obsolete as was the CT2 when it came out.

CT60 looks like a better design than the CT2, and I'll probably buy one if
it appears. If it lasts as long as my Afterburner I'll be happy.

Yeees. If you have MiNT installed on your computer :(

Please, here is a part of a README file:

"2. What do I need?

[...cut...]

At the moment, a running MiNT system with at least AES 4.1 (or MagiC,
not tested yet) and 16 colors or up is required."

Once upon a time <siAI5.3579$IF1.432097@nnrp3.clara.net>, Shiuming Lai
<shiuming.lai@freeuk.com> grabbed chalk and scrawled:

>The 16-bit stereo sampler from AVR was a
>fairly high-end product coming in a carry case
>and having its own power supply. Cost about
>ï¿½350 when new.

Sounds good ;)

My Atari probably cost ï¿½400 new, I think it's worth ï¿½50 - maybe - now...
Still, I imagine such an expensive object is a: hard to find and b:
probably still in use by the current owners.

>I suspect you may be after the cheaper mono
>version, Replay 16. This also plugs in the
>cartridge port, but you have to be aware that
>it's a large L-shaped thing which obstructs

So does/is the Stereo Replay - even though the board inside isn't L-
shaped. Why would I have to go to a mono version, though, it seems
silly.

>It has MIDI trigger capabilities.

The same as the Stereo Replay, though software?

>Replay 16 is available from System Solutions.
>sales@system-solutions.co.uk, brand-new,
>I think about ï¿½99.

Hmmm... I can get a second hand EMU ESI 4000 for ï¿½400, and basically
solve the whole sampling thing ;)

>Forget the serial-based solutions, lousy timing.

I did wonder about them.

>If you're using Cubase, you'll be in luck.

I'm using TigerCub. MasterTracks doesn't like medium res, and I like
Tigercub - it's spontaneous.

>System Solutions also has the excellent
>SoundPool MO 4. Gives 4 extra outputs,
>all with the same timing quality of the Atari,

>and plugs in the parallel port. Very solidly
>built in a metal case and ultra reliable.

Sounds like a good solution...

>I know you said "swap" but this might be
>useful in the event you don't get what you
>want for what you're offering.

I think if I get into new stuff, then my solution will be to get a rackmount PC case and build a simple PC with MPU-401 combination (all my kit is ancient anyway). It would get around the problem of GenEdit crashing whenever I try and do, well, anything with it (it has D-50 patch editor templates, but they are utterly useless since the computer crashes if I ask it to do anything involving communication with the synth - except monitoring MIDI), plus the frustrating situation of almost all the decent software being written for 640 x 400 minimum res (and often looking crap on anything other than a Falcon).

<richard@lovecraft.demon.co.uk> writes
>So does/is the Stereo Replay - even though the board inside isn't L-
>shaped. Why would I have to go to a mono version, though, it seems
>silly.

The 16-bit version is called Replay 16.

Stereo Replay is Microdeal mid range priced sampler which is 8-bit, it
has a nice program with it that can run in hi/med rez.

Stereo Master is their budget sampler, the program that comes with that
is a lo rez one and is very basic.

The other sampler, which incorporates video, is called Videomaster.

Most ISP's have changed over to CHAP. Unfortunately, BT Internet are one of

Maybe we could persuade Dan to add CHAP to STik2??

Ok. It truly seems we have a miscommunication problem, and it may be my fault. Apologies if I've said anything that is insulting.

>There are several problems with this concept though:
>
>1. Who's gonna design and manufacture it?

Design it...not sure. To some extent, why not us? Manufacturing can be done on a smaller scale, and not be too incredibly expensive. By this, I mean making the stuff that just can't be done by a hobbyist... pcb fabrication, etc. Soldering could concievably be done by hand.

>2. When will it be available?

Good question. Unfortunately, definitely a long wait, and probably never.

>3. What will it cost, and how to distribute it?

Cost would be the cost of the components. If we can keep it simple, a motherboard could be under $500, maybe less if we organized a group purchase

>4. What about repairs?

We're putting them together. I should hope we'd be the closest to experts there are for it. We all help each other out, shouldn't be any problems. Lesser electrical type repairs (bad cap, burnt resistor) shouldn't be too hard to take care of.

>Since we're talking very small numbers here (with a little luck perhaps a
>couple of thousand boxes)

Don't kid yourself. 2000 units would take alot of luck, 3 miracles, and a UN mandate.
I'm talking 50-100.

>I can't see how this can compete with already
>existing hardware.

Why does it have to compete? Apple and other companies have to compete, otherwise they go bankrupt. I'm not talking about starting a company, that would be insanity. i'm talking just a hobbyist project.

>The only realistic way to use a PPC would be to use
>Macs, but they are a lot more expensive and harder to get. Atleast here in
>Norway Macs sell very porly to the public, almost all Mac-dealers
>specialise in the business-market and price their boxes accordingly.

Dude, cept for shipping costs to Norway, we could buy the components, and you'd pay the same as everyone else. Unless there is some duty or tariff I don't know about, things should be OK.

>something.

I'll try to be polite. PPC is only the cpu... platform is more than this. Concievably, there could be a platform that would use the x86, and still not be "PC" (once called ibm compatible). If it used different slots, didn't use a compatible bios, etc. To my knowledge, that never happened though. Maybe because it was a garbage chip.

Again, platform is the cpu family, firmware/bios/rom, and various other details all rolled together. If a particular OS will run on it with zero, or very minimal changes, this is a good test of the platform (amigaOS wont run on the Quadra, so even though both are 68k, not the same platform).

>> A platform doesn't necessarily mean the same thing as the platform,

Hmm, I must have been up late. That typo should read...

>As Henk pointed out, this is a very good explanation of the fact that
>platform == OS.

This ignores that several OS's have been multi-platform. The day that NeXTstep was released for sun, hp, and intel x86, we didn't see some magical merging of those all into one platform.

Also, it ignores that there are a buttload of OSs to choose from on some platforms. They don't fragment into thousands of platforms either.

Think of platform as hardware, and you'll be ok. There is more to it than that, but it's close enough.

Source record: 55882

Dude.

Whether or not an x86 can be faster, for less money than a PPC, that's not the point. Some of want a different computer, maybe even for the sake of it just being different. We're even willing to pay for it both in $$$, and in cpu speed, to a lesser extent.

It's like if there were only one flavor of soda in the world. You're saying "let's not make another flavor, it will certainly be more expensive". "Besides, they all kind of taste the same anyway". Maybe the second flavor won't be better than the first, but just it being different might be enough. And you can't make it different if you want to use the same exact ingredients.

Thanks,
John

Get real!
Most studios around the world actually DON'T use Ataris, believe it or not.
You don't have sample accurate sync on an Atari - but with a real midi
interface on a PC you have it there - so nowadays, a PC is even better for
midi applications than an Atari machine...
The main reason for midi timing problems is when people try to use crappy
gaming soundcards for midi - and that's impossible to use other than as a
toy! This is not a general problem in the PC, but a problem within the
soundcard!

Good choice, I also made this choice. Everything works fine, with the
right software you can do this. Although I think you should consider
using a Linux PC... much more flexibility and almost all soft is free.

> What I then have to do is to return to the wonderful STinG and use the Vassilis
> Papathanssiou ETHER_PA.STX module?

Yup, that's right. That's all you have to do. The installation isn't
very hard and the speed is OK.

You may want to look at these pages :

http://gallery.uunet.be/saka/atari/ethernet/genius.htm
http://gallery.uunet.be/saka/atari/reality/rtl8012.htm

And also this page :

http://www.asamnet.de/~hilgarte/ether.htm
Elmar sells everything in a package for a fair price.

Good luck.

Would it be feasible for some small company to "take over" (or whatever)
the boards (or the complete boxes) of some of the lesser (older?) Mac clones,
which seemed to be substantially cheaper than "real" Macs?
Or perhaps to persuade some Mac-clone manufacturer himself to adapt
and sell an "Atari" variant. There may be some profit for them in selling,
as you say, "several thousand boxes".

What I mean is not to run TOS (MiNT or whatever) in emulation over MacOS
but to replace the ROMs and boot a PPC-specific Atari OS.

BTW are the ANY Mac-clone manufacturers around? I am afraid that they
were practically exterminated in one of Apple's lunatic moves.

Do I understand correctly: the new OS/emulator would have to use a XHDI-compatible, x86-specific driver. Not some driver that can (can it?) be loaded in existing emulators?

>> Magic PC also has a "real" VDI driver, doesn't it?

I agree, and I don't understand why none of current emulator authors included this. AFAIK 6888x FPUs use a rather limited and well-defined set of instructions. And it is disappointing to see some emulator achieve, say, 50xST speedup in integer arithmetic but only 5xST speedup in floating-point calculations.

Yes I think it was. I recall an article in Byte many years ago
describing the launch of GEM. There were fairly stringent conditions
which put a lot of people off.

| Still the xx86 series do seem particulary convoluted in their
|workings, or perhaps it's users expecting to use more than 640K of memory.

It was the thoughtlessness and restriction of the design which put
me off the xx86 series and the commonsense which attracted me to the
68000. (Also I had some experience of programming a DEC PDP11 in the
1970s, and the 68000 resembled it.)

This reply is from a shell account, so I cannot just go an look, but the
dial.scr text file, near the beginning, has a number flag to set, to
combine header compression and PAP to get CHAP.

This is with sting 1.15.

This is an opinion, and some opinions are better than others.

Do not give up yet.

Not really. It complicates a process they tend to like to streamline, with
little incetive to do so. They'd have to charge more for the atari variety,
and that kind of thing kinda kills the notion.

>BTW are the ANY Mac-clone manufacturers around? I am afraid that they
>were practically exterminated in one of Apple's lunatic moves.

None. Apple makes more money from hardware, than from just licensing the OS
and roms. Still, would be cool if there were clones. Maybe the PC would die
off.

You twist my words. I said, that if OS=platform, since unix will run on everything modern, and most that is even ancient, there is only one platform, the "unix" one. Since this is obviously ludicrous (I hope it is anyway!), it should follow that OS does not equal platform.

Thats what I've benn thinking over the last few weeks. There must be
some kind of small socketed EPROM on the board that (similar to TOS)
can tell the CPU to load off the hard disk. Boot strapping I suppose.

Now all it would take is a patched TOS or even just a small EPROM or
some sort of microcontroller that would take the OP codes
from all 68k programmes and change them for the PPC.

Would be realativly cheap.

If you were to make a new motherboard PPC would defianatly be my first
choice as it doesn't have multiplexed address and data lines, which
would make things yet more difficult. And the OP codes must be very
close to the 68K architecture as they were, presumably made by the
same team.

Nowadays tar and gzip can be used by everyone. It's as easy to use as Zip
or LZH.

All what you need is GuiTAR, gzip and tar. GuiTAR is a GEM front-end for
tar. Very easy to use. I've assigned GuiTAR as an application to unpack
tar, tar.gz and tgz archive. So whenever I double click on such an archive
GuiTAR comes up and do his work. Very much like ST-ZIP or LZH-shell.

GuiTAR can be found on the Belgian ftp-server

ftp://chapelie.rma.ac.be/atari/archivers/guitr05.zip (98.131 bytes)

tar and gzip are also in the archivers dir

4414. SWAP: Atari Jaguar for MIDI/Sampler stuff

Newsgroup: comp.sys.atari.st
Date: 2000-10-22 00:00:00 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <bPYw1VClvi85Ew$G@lovecraft.demon.co.uk>
Source record: 55944

I've posted this in the past, but didn't really know what I wanted - now I do ;)

I'm after a 16-bit sampler, such as the Stereo Replay's Pro version (not sure of the details, just know that my Stereo Replay is only 8-bit), and/or a more advanced MIDI system. I've seen STs with cartridges that presumably add MIDI ports, as well as Serial based solutions (I'd rather not go that route, since I don't know how stable my serial port is - it's been RSVEd).

I'm also looking for an SM124 within safe travelling distance of the Scottish Borders, since a lot of the rather nice Electronic Cow software won't run in less than 640 x 400 colours.

Richard, just acquired an MC-202, SH-101, MIDI-CV convertor and various other useful things...

What you want is the Replay 16, which is a 16-bit sampler. I know
someone that uses 2 of these on 2 STE's, each STE making up 1 track.
They do the job WELL:)

YOu shouldn't have too much trouble with the serial ports, as AFAIK midi
doesn't use a high frequency:)

>This illustrates perfectly that the hardware is totally irrelevant.
>Platform == OS

Ah. So you are a retard also? Don't know why it suprises me, the world is full of them.

Platform != OS

Else, since everything runs unix, there is only a single platform in the history of digital computers. Hmm. Interesting premise. Why don't we just oversimplify things so much that we can say whatever we want, for the hell of it. Who cares if it is productive or not.

I have an idea. Why don't you, and your clan of backward little emulator worshippers go hide in a cave somewhere, so that you don't annoy us while we try to decide what a new atari should be.

John

4417. ISA to ST/TT

Hi,

Does anyone know anywhere i can find diagrams or instructions on using
ISA or E-ISA PC cards on an Atari ST or TT?
Also, is it possible to upgrade the TT's 68030 CPU to an '040 or '060 or
something along those lines?

cheers,
Marc

Yes, I can't deny it is religion.. I just thought you had the same
religion as me.. and other ppl here. Sorry, I was wrong. It is against my
religion to let a x86 based faceless piece of cheap shit run "my" OS. I
can't tell you why, but to me the PPC IS closer to the m68k line than
anything else.

Simply because it then would be a "PC", not a "Mac"! That simple.
People wouldn't even recognice it as an Apple machine. .. just a faceless
"PC". It would loose its personality. Thats it.

> performed better, and switched from PPC to x86 the same way they switched

You just dont WANT to understand? Neither Milan's or Hades were
manufactured by Atari, but I regard those as Atari machines nontheless.
Okay, they have genuine m68k cpus. Ok, talking about Mac's and how the
emulation were done on it. What OS did they run their emulatied OS on?
Answer me that.

>

Sure about that? I did some risc assembler on the jag (perhaps extremely
not similar to PPC, but ..) and I found it downright easy. But, I'm in the
process of learning C, so I guess that won't be a prob :)

Now.. I've heard that G5's were classified as Supercomputers here in
Norway.. are they really slower than cheap PC's? I think you need to get
quite an expensive PC to match its powers. Unless something happened that
I didn't catch....

>
> And most importantly, I'm sick and tired of waiting for the next superfast

Try to find a file "SMC*.ZIP" (I believe it was called SMC1.zip but am
not sure).
This file describes an ISA to VME interface used for connected an SMC
based tehernet
card. It will work with other cards as well.

If we help Hasbro make more money for them using the Atari name, why wouldn't they be interested? Especially, if they don't have to be involved (well, unless they want to port some of those Atari classic remakes of theirs)?

See it like this:

If you gave $1,000 to someone and they paid you back in a few months and then you started getting a check for $250 every month thereafter without you having to do anything or be involved at all, wouldn't you be happy?

I'm hoping Hasbro see it the same way...

[Sorry in advance for the cross-post. There's a little bit in here for everyone]

In an effort to avoid using eBay to sell classic gaming stuff when I could be trading, what follows is my painstakingly created trade list. :) Sorry, but nothing is in alphabetical order. :/

ATARI 2600

Ghostbusters (Blue label)
Frogger II: Threeedeep!
Pitfall II: Lost Caverns
Space Shuttle (Blue label)
Sky Diver
Pong Sports (Sears)
Pole Position
Maze Craze
Super Challenge Baseball
RealSports: Baseball
Combat (x2)
Football
Superman
Cosmic Ark
Breakout
Atlantis
Space Invaders (Atari)
Space Invaders (Sears)
Street Racer
Target Fun (Sears)
Video Pinball
Pitfall!
Outlaw
Frogger
Air Raiders
Asteroids
Missile Command
Night Driver
Grand Prix

ATARI 5200

RealSports: Football

COLECOVISION

Complete system - works! (Console, power supply, 2 controllers, switch box, RCA cable)

VIRTUAL BOY

Wario Land (complete, w/ box & instructions)
Red Alarm (Japanese Import, cart only)
AC Adapter

GAME & WATCH

Donkey Kong (works, missing battery cover)
Mario Bros. (works, has battery cover)

VECTREX

Vectrex system (does not power on, no sound, just a dot in the middle) w/ not-so-good controller (non-centering). Definetely a fix-me-up project - I'm just lazy! E-mail for more details.

MISC.

M-Network TRON Joysticks (Blue!) (x2)
TRON Joystick look-alike (Black, has retractable cable)
WICO Command Control Joystick (long handle)
Colecovision controller (Black)
ADAM/Colecovision controller (Beige)
Parker Bros. Merlin handheld game
Coleco ADAM 5.25" Disk Drive (w/ power supply)
Coleco ADAM spare Digital Data Drive (tape drive)
Atari Ultra Pong Doubles (complete in box)
Atari ST SM124 monitor (works, but has lots of stickers all over the housing)

Cartridge/tape holders:
1) Atari binder (Orange with Atari logo on it), holds 8 carts
2) Holds 12 carts (x2)
3) Modular system holds 16 carts
4) "Lazy Susan"-style tape holder (i.e. rotates) - used to hold ADAM tapes - holds 20 tapes (x2)

I can provide pictures of whatever you want (from this list :). My want list is extremely huge, so send me your trade lists if you are interested in anything here! I am looking for just about anything pre-NES... Most importantly, hardware or carts for the following:

2600, 5200, 7800, INTV, Coleco, Virtual Boy, real old (RCA Studio II would be awesome, Channel F, etc.), Atari ST games, etc.

Anything I don't trade will be eBay'ed. :)

Thanks!

Joe

Not you or anyone else in this newsgroup could every make Hasbro more money by using the Atari name. Hasbro could careless about Atari computers. They would be involved just by the use of the name Atari. There is alot more to it then just say hey Ill give you money for the use of your name. Hasbro pisses away more money in a single day then it would cost to produce one of the already made atari clones.

You go ahead write them a letter send out and let everyone know what they say. I bet youll never get a response saying sure that sound great go ahead with your project and you can pay us later.

I really cant believe that this thread has been going on since July. If you were serious about this you would have already started a project.

If they "piss away more money", as so you've said, then it shouldn't be any problem for them to invest in something they will only benefit from and get money out of without having to devote manpower or time or energy.

Benefit my ass. Join the real world and pull your head out of the clouds.
What you think ever in the whole damn world is going to drop there PC or MAC
and join on the Jared bandwagon to build a NEW ATARI. Its been done and in my
opinoin all the clones have failed. If you dont think so please go down to the
local computer shop and get my a Atari Clone. Ive yet to see anyone in the US
sell a Atari clone. Everyone Ive heard that has a Atari clone has purchased it
from overseas.

If you have ever done any business with a large corporation you would know that
the money that you say Hasbro would see from your Atari Clone would be lost
just putting in into their Corporation.

One man can only do what he sets his mind to do. It doesnt take an army to build a computer but, it takes an world of consumers to keep it alive. Take a look at Dell computers....

<Thanks to everyone else who's replied>

Yep, I got to a prompt "ascend%". Managed to get a help screen, one of
the
options was the entry of the magic letters PPP. This brought up an error
message to the effect that I was not authorized. I guess that I should
have
been authenticated via CHAP first, although there had been no attempt at
data exchange for this that I could see.

I logged in with the laptop with logging active and saw that a CHAP
authentication block had been accepted.

That reminds me, there's a report on the MagiC Online pages that someone (Vasillis?) was developing the necessary kit to allow the use of MiNT-Net stuff under MagiC? There was nothing about this on the page that the link pointed to.

The latest beta version of GEMTrade is the only contender for French-
>English, but I have to say that it isn't very good at it.

I suggest turning the doc into html, put it onto a web page, and point
the translation engine at Systran at it. I find this is reliable on the
Atari.

You can do it both ways, both will work. It doesn't matter if you write the driver in 68k or x86, except that x86 will probably be a lot faster. I'd guess that the easiest way to do it is to put the driver inside the emulator/microkernel itself.

To get current MiNT-kernels to work with existing emulators you could write a hd-driver for them, or you can write a new FS that use the filesystem of the underlying OS. Personally I wouldn't spend any efforts on emulators that needs another OS to work.

Thanks for the concern! I'm quite ok, but I've been taking it easy on the Atari scene for a while. Still lurking from time to time, but I haven't quite the time to participate as much as I used to. Kids, work, etc...

The Quick FAQ is still up and running, a minor update will probably be due soon with the latest bad news about the clones, and the good news about STiK 2.

New PC, so my .sig is gone, so for those who don't know, the Atari ST QuicK FAQ can be found at http://bales.online.fr/atari or

http://quickfaq.atari.org

Just like that other guy said: "I'll be back"

Nick

What happened is that the Mac is turned into a PC with a different CPU.
Since you regard the CPU as only a part of the platform, perhaps you
should regard current Macs as PCs, and MacOS as just another OS for PCs?

> Again, platform is the cpu family, firmware/bios/rom, and various
other

Again, radical changes was done to MacOS and Mac-apps which makes 68k-
Macs and PPC-Macs just as incompatible (no, make that *more*
incompatible) than PPC-Macs and PCs. So tell me, which of these Macs
are true Macs by your logic? The old 68k? The new PPC? Are there two
incompatible Mac-platforms? Or is it *one* platform, defined by their
common OS?

> >As Henk pointed out, this is a very good explanation of the fact that
> >platform == OS.
>
> This ignores that several OS's have been multi-platform. The day that

Only if you consider the hardware only as the platform. But then you
suddenly have two Mac-platforms.

> NeXTstep was released for sun, hp, and intel x86, we didn't see some
magical
> merging of those all into one platform.

No, not the actual hardware, but NetXTstep is still *a* platform. And
BeOS is also one platform, even though it now runs on PCs instead of
the cool, but dead, BeBox.

> Also, it ignores that there are a buttload of OSs to choose from on
some
> platforms. They don't fragment into thousands of platforms either.

Only if you accept that a particular piece of hardware with no OS
should be considered a platform. IMO there's no such thing as a "x86-
platform", but we do have Windows (in various flavours split on two
platforms, DOS-based and NT), Linux, BSD in various flavours, BeOS and
countless other more or less popular platforms that runs on the same
hardware.

> Think of platform as hardware, and you'll be ok. There is more to it
than
> that, but it's close enough.

No it's not. A PC with Windows and a PC with Linux is not the same
platform. However, a PC with NetBSD and a TT with NetBSD is.

Hi Jo,

Don't normally join in inter-soapbox yells such as this, but here's why whisper.
I tend to agree with you. In the beginning, sounds biblical doesn't it!, 'the platform is defined by the hardware rule', ruled. An IBM compatible was constructed, and to the user, operated in a manner manifestly different from say a Mac, an ST or an Amiga. Then along came the GUI and users started defining by usage the platform on which they worked by how it looked and responded, its 'look and feel'. Then, for the PC line, came the application of the de-facto standard Windows, which was applied to hardware not necessarily using the Intel series of processors. The same thing was slower to occur with the Mac line. Every PC compatible is designed such that to the user, running under a specific OS and GUI the specific hardware should be invisible, the various manufacturers strive to make the various features of say Windows run/operate faster, not different. If this were not so how could software writers possibly operate. Even the above line is too strict when applied to the 'Atari Platform', eg my Milan uses a 68040, Atari pedigree, yes, runs under NAES/MINT OS, Atari pedigree, bit of experimental breading creeping in here, and I use Thing as the GUI, more experimental breading. Is the resulting animal the same as the timorous little MegaST lying dormant on the floor. You tell me!

I've just got out the crayons, and scribbled atari on my IBM t20 laptop.
Now, the platform has magically changed, and dare I say, I own the most
advanced atari on planet earth. Kneel and worship.

Hi,

> Why not just connect your Falcon directly to the net?

Because there are a lack of net protocol on Atari (Mint/TOS/magic).

> Who said you can't? Doesn't STiNG support DHCP?

No, and the DHCP isn't all.. Sting (or MintNet) doesn't support also the
PPoP (absolutely necessary for a LAN/ADSL Connection in Europe).

Hi Steve,

> Hi Butt hole supporters.

Once again forgetting to read the post properly? You seemed to ignore the fact that none of us said we fancied Jareds ideas. I just think he shows he knows how communicate with other ppl in a way that suits this newsgroup. That said, I do not at all agree upon all stuff he says.

What is the point for you to keep on posting here if you have no interest in either respecting other peoples opinions, or send a serious reply to a serious post? Mine was 100% serious, I can assure you that.

> >> > Your so full of $%&...
> >>
> >> I think you should watch your language. This posting adds nothing
to
> >> the thread but is only an insult. Nothing more, nothing less.
> >>
> >> I don`t say I agree with everything Jared says, but he should not
have
> >> to put up with _crap_ like this :/
>
> My heart bleeds, are you expecting his babies.

Thanks for proving my point. You have not even taken the time to qoute correctly, you are answering several posts at a time. Also you have not in any way told us why you think you have the right to kick ppl from this newsgroup. And most of all, you are completely neglecting to do anything but trying to tease ppl, totally off topic.

> Jared is an example of that.

Is this a joke? He has posted ideas (sometimes radical though, and mostly dreams) whereas you seek to piss him and lot of other ppl off.

Get serious or do not reply, that is my advice.
I am pretty sure many more than just me thinks this is far more important than keeping quoting short

I fully understand the desire to be different. After all, I'm using Ataris (and constantly spending $$$ on them) too. But there are limits on how long I would wait for the next "Atari", not to mention how much to pay.

Perhaps if you live in a world where you don't have to make money. But designing and producing a new computer is time-consuming and expensive, something Milan Computer probably can tell you all about. The Phenix was supposedly finished, but what happened? Have you seen any new Amigas lately? Or a BeBox? Or the Milan2 for that matter?

> And you can't make it different if you want to use the same exact
> ingredients.

Sure you can. Both Corvettes and Beetles are made of steel, plastic and rubber, still they look and feel pretty different to me. I'd say that a "PC" running FreeMiNT+N.AES is closer to my Falcon than my Windows-box.

I wouldn't dream of contradicting such an expert as you on hard disks,
but what I posted doesn't disagree with that, i.e. that you can't use
clusters *smaller* than 1 KB. I said nothing about not using *larger*
ones with more sectors :-)

>function in HDDRUTIL.

Sorry Uwe - where? I can't find it in my (German) handbook that I got
with my (English) V7.71 of HDDRIVER, and couldn't find it when running
HDDRUTIL 7.71. I'd be grateful for a location of the reference. Are you
saying that MagiC accepts 1-sector 512-byte clusters on hard disks? Up
to what limit in partition size? I would have thought you would run out
of FAT space with large partitions....

4449. PowerPC 1040ST...

Newsgroup: comp.sys.atari.st
Date: 2000-10-23 00:00:00 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <0X_I5.767$qj2.128227@news.goodnet.com>
Source record: 55826

Are you being serious or just joking? From the ton of skepticism about reviving the Atari name/computer line, I'm unsure.

Oh yeah... I'm back on THAT track again, thoroughly convinced that the only TRUE Atari computer is an ->Atari<- computer. But I'm approaching it from a different perspective. One of personal inspection and investigation, using the example of that 1040ST I was asking everyone about to see if I should buy it for $5.50, seeing if I could use it with an A/V TV.

Well, I'm gonna buy it and take it apart! Now other way to see how it could be made to be a PowerPC system inside that oh, sooo recognizable case.

"Neotari" is merely a way around the problem (and not likely a very successful one at that). Getting Atari back is going THROUGH the problem. Not saying it CAN be done, but it MAY be possible, *IF* I get all my logistics worked out both in hardware and concerning the people who would be willing to help make it happen.

And if Hasbro financed the operation? Well, that's THE key to it all... will they be willing to invest to start an Atari Computer division, provided we show them a roadmap to how successful it can be. But ya gotta have EVERYTHING there... the people ready to buy, the system design, the reasons of how, why, and where. You miss one tiny detail and Hasbro will probably see it and walk out. We have to convince them that it *will* profit THEM. Not us. We're just in it for personal reasons, though we benefit financially because we run the company FOR Hasbro. Sounds crazy I know, and may not ever happen, but what harm is there in at least trying? Do any of us lose anything if we're no worse off than we are now? I can't see how.

But I believe that starting out with the original 1040STand Mega ST cases (at the expense of user expandability... for now... later models can be modified for more expandability) is the only way to successfully reestablish Atari in people's minds and regain mindshare with the public. Ya have to admit, no computer made past or present looks like an ST... and that, I believe, is the key to successfully restarting Atari... the computer company... once again.

AFAIK there are not small but large (about 512KB?) ROMs in Macs and
they contain not only the bootstrap code but also a number of low-level
routines of MacOS (something like BIOS? I don't know much about MacOS...).

I considered this in line with "if you could live with DOS for a while..."
that you said. I agree that no-another-OS approach would be much nicer.

What I mean is that I can live with having DOS (that's 3 files or
something like that) just so one can boot the emulator, but the emulator
shouldn't use the underlying OS to access filesystems or
hardware. E.g. MagiC-PC maps GEMDOS-calls more or less directly to
Windows, which means that you need a working, powersucking
Windows-installation in addition to MagiC.

4455. Atari Mega File Questions

Newsgroup: comp.sys.atari.st
Date: 2000-10-23 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8t231e$fo9$1@nnrp1.deja.com>
Source record: 55832

Just recieved this, and I really don't know how to answer this. Can anyone here help?

Tim

Hello Tim,

I'm sending out this problem description to everyone I know that is fimiliar with Ataris to see if I can get some help. If you don't mind taking a moment to read it over, I'd really appreciate hearing back from you if you have any advice.

atari megafile HD problems

(1) I have an old Megafile 30 external hard drive which I use with my 1040Ste. The drive has never functioned properly, and according to the original owner, the only way to get it to respond is to let it "warm-up" for 30 minutes before booting the STe. This seems to work most of the time but it is unreliable and inconvenient. It's been suggested that my Megafile is simply too old and cannot spin at the proper speed. If you have any suggestions for repairing the drive, I'd appreciate hearing them before I dispose of it.

(2) I recently obtained a second Megafile 30 external hard drive which functioned perfectly. My STe was able to boot from it immediately without requiring a floppy in the A drive. I had an idea and connected my older Megafile 30 external hard drive (see (1) above) to the new one to see if I could have both drives connected simultaneously to them same STe. I neglected to read in the manual that the second drive must have it's internal DIP switches set to a different number.

When I tried booting with both Megafile 30 external hard drives connected, the busy lights on both drives activated , but the STe didn't recognize either one. I disconnected the older, troublesome Megafile 30 external hard drive and rebooted with only the good one connected. My STe will no longer recognize the second "good" Megafile 30 external hard drive even when I boot from a floppy!

Did I damage the good Megafile 30 external hard drive by trying to boot with the second Megafile 30 external hard drive connected?

Could the problem by a mechanical one that occurred coincidentally during my two-drive experiment? Could the problem by viral and spread from one drive to the other?

(3) Are there any new, reliable external Hard Drives currently
available that I could use with my Atari 1040STe?

Thanks Tim!
Hope to hear from you soon.

Luigi Allemano
Montr&#65533;al, Qu&#65533;bec

As others have said before in this line of thinking, I think trying to completely revive the "Atari" name is very problematic, especially with Hasbro involved. First, to get Hasbro to work with you might not be as easy as you think. You've got to look at their reasoning for owning the Atari name. It's solely for the purpose of using it to "modernize" some classic video games (and for PC's only, no less). And as we've seen recently with the problems Atari Games/Midway had, I don't think Hasbro is very keen on anyone using the name for anything else but their own purposes. Second, even if you could get Hasbro's attention, companies like them often have very specific long-term goals for their investments. As I'm positive making computer hardware isn't one of them, your chances of getting them to completely switch their focus and put money into something that likely goes against their company's long-term vision are next to nill.

Besides, most people don't know the Atari name for anything but video games. If they do relate it to computers, it's more likely to be associated with obsolete nostalgia, or possibly even animosity, as the original Atari company really screwed some people (especially vendors). The only ones who know better and love the Atari for what it can do now and in the future are those of us right here who already own them.

> believe, is the key to successfully restarting Atari... the computer
> company... once again.

Yuck! I hated the old ST case! It wasn't very desktop-friendly as it took up way too much space, the keyboard felt horrible, it wasn't easy to move the keyboard out of your way when you needed the extra space, and was a

nightmare of cables and parts trailing across your desk. No thanks! If we are to see another Atari computer, I'd much rather see separate keyboard and tower (or desktop) case design. That's what most computer desks are designed for anyway these days, so it would be hard to fit it in aesthetically and ergonomically.

Now having said all this, I do want to say that I like your enthusiasm and vision. I'd personally love to see a PPC-based Atari. I recently purchased an iMac, simply because my Falcon was very lacking in the speed and internet areas. So I use the Mac for internet stuff and some other minor things where speed is an issue, and my Falcon primarily for music. I much prefer the Falcon as far as it's Operating System flexibility and the software is really pretty good for the amount of support the computer has compared to PC's and Mac's (and of course, I prefer Mac's to PC's, which are just disgusting to use, for me anyway). I'd love to see the Tempest card become available, as it seems to be the only Atari-related device promising this very necessary move away from the dead or dying 68k line of CPU's.

If there is to be any new Atari-compatible computer, it has to conform to certain modern standards, both internally and externally. It must not only be fast, usable, and offer the user something Macs and PC's don't, it must be given an attractive, modern, ergonomically-sensitive design that fits in with modern surroundings. It must be able to do everything a Mac and PC is expected to do (including Internet with Java/Javascript, multimedia plug-ins such as Flash, Shockwave, and streaming Audio/Video, etc) at speeds at or above Mac/PC speeds. So before a design can ever be in place, software must be there, and you must get enough funding to produce ultra-fast, high-end hardware at low prices, otherwise no one will take anything you try seriously and your plan will flop.

So keep working with your ideas. While I think you may have some problematic reasoning, you have the drive to see the advancement of the Atari heritage. Perhaps you might stumble on the right keys to get something going! I sometimes have this day-dream of what if there were a way to not only make a new Atari machine, but find a new niche that is universal enough that everyone had a need for it, and could come up with the money somehow to market the heck out of the machine. It doesn't have to have the "Atari" label on it, as long as it was Atari-compatible, fast, and feature-packed. Anyway, whether or not it's only a dream, it's a good dream to have.

To be honest, I always thought the ST case was a bit ugly, the Amiga one
seemed a nicer design. (well, aside from that bloody great modulator
sticking out of the back :)

We might be making progress, I can at least see your point of view. And it doesn't look ridiculous to me either.

Who says we have to make money at this? If I were choosing business partners, it wouldn't be over usenet, to make a product that is the financial world's equivalent of a black hole.

Actually, there may be new amiga's soon, though I won't hold my breath. The way things look though, I don't consider them real amigas (nor clones) either. It is sad that there are no new beboxes, nor that I am unlikely to ever own one. Maybe we shouldn't wait for a Milan2.

>box.

Hmm. This isn't fair. What that corvette had a beetle engine in it, and the fiberglass body were removed, and beetle fenders were bolted to it as best they'd fit, and it had beetle tires and upholstery... would it still be a corvette? Even more importantly would it even be a beetle, or would it just be some messed up piece of junk that was ugly and didn't work too well?

Let's start talking about what we want a nextgen atari clone to be. Pay no attention to cost, but don't go overboard either. Then we will have something to work with, and we can see if it would be cheap enough to build as a hobbyist's kit.

A piece of cake. ;-) (Big tongue in cheek)
The interface to MiNT wouldnt change of course.
The trap 2 code could be implemented as a device driver.
The trap 2 itself is of course executed by the emulator.

Unfortunately intel cpu's have alien biology inside. It is called endianism.
Impossible to explain what it is, let alone how it has reach the earth.

Or not. OSIS needs another OS - Linux - to work, so in this respect it's
not much different from MagiC-PC or GEMulator.

Would it be possible for "us" to cajole or buy-out or simply pay royalties
to Hasbro for the Falcon engineering? Tweaking an existing design, and
fixing known bugs (rather than experiencing new ones with a new design)
would be considerably cheaper than designing from scratch.

Just a thought. Not my best one.

Here's a better: There is a movement (however glacial) to create an open
architecture PowerPC platform based mostly on CHRP (or whatever the last
acronym was). RioRed was one of these, there are others. If people are
really serious about creating an alternative platform ("platform ==
OS + hardware architecture), it would be way better to get in on an
already-underway alternative platform that other people than just a few
Atarians are interested in. Logistics are part of this larger movement.
Check http://www.openppc.org/ for the idea.

Just like the Mac's transition from 68K to PowerPC, emulation would only be required for old binaries; existing applications would be ported and new ones written to run on the platform's hardware (CPU + memory + peripherals) natively.

Here's a thought. Linux took off from very meagre beginnings to become a respectable OS that runs on Intel machines, Mac machines, and other beasts. Why could TOS/GEM not do the same? Certainly a peecee or a Mac running TOS/GEM and Atari apps would not be the same thing (spiritually) as a real Atari computer, but realistically speaking, a TOS/GEM-based OS that boots without the agency of foreign OSes on any given machine is the best bet for the Atari idea to flourish, maybe even spread from this tight little group of fanatics.

What would it take to turn TOS/GEM into an Open Source experiment that could survive the demise of a parent company? Getting original Atari TOS source and maybe Atari DR GEM source released to the public domain? (ha ha) Maybe getting ASH to let go of MagicMac and MagicPC? (ha ha) Maybe port MiNT to boot/run on PPC and x86? (hmm...)

The parallel adapter is slow, yes.
Just because your ISP only claims to support one system doesn't mean that you
can't use any system you like. If that were the case, a lot of Atarians would
be without a dial-up ISP as well.

>To give my 40 MHz Falcon (eXtender) 12 MB RAM with four SCSI-drives, CD-ROM

It happened some times. In Japan, there was/is a very popular computer line
called "PC98", which has got its own bus and only runs a particular version of
Windows (I think it ran its own jhome-cooked DOS version before).
Similarly, in Sweden, there was an odd educational computer in the mid-
eighties, based on an 80186 CPU, while incompatible with the IBM.

>Again, platform is the cpu family, firmware/bios/rom, and various other

Does this mean that I can use cablenet on my Hades? Beside that router is
something else required. I have a NE2000 PCI network card on my Hades.

>I have got a null-modem cable. I need the softs.
>Can anyone help me ?
>Thanks

Hmmm! let me think.

The simplest form of transferring for files that won't fit on a disk is using a terminal program on both machines. However the data transfer isn't blistering, if fact you could have a kip in the time it takes to transfer a 1 meg file! and even worse at 19,200.

The big drawback, apart form the speed, is that you have to imput from BOTH machines. Which brings us nicely onto Ghostlink.

I've never been able to get Ghostlink to run on a Pentium class machine, but I have run it on a 486!!! Strangely with an unmodified ST I could only get the program communicating with each other at 38400bps!!!

But once launched you can use the pc drives and resources as another drive:) However speed isn't it's best selling point:(

There are other programs, Paralink is one which I haven't tried yet.

For small files, as I've mentioned, transferring via disk is the best method. For large files there are programs that will allow you to break up a file into n amount of parts of n size, and reassemble on the other computer.

>

The beauty of the TOS platform, in my eye the ST, is that everyone has
the same hardware support. I've got a couple of pc's and I've yet to
find software that runs the same on all machines.

I've had to return software due to hardware problems on 2 of my
machines: Driver, Unreal Tournament are just a couple of them not
mentioning the serious software.

With the ST we all have the basics, although limited: disk drive,
rodent, midi, monitor output, sound, keyboard... in a throw under your
arm casing:) AND more importantly is easy to use (disks not included).

If someone could come up with the same type of concept, I think things
can be different!

Actions generally speak louder than words. If they had any
interest at all in the computer line they would of gone after
it already. They are way bigger than any of use here, and
have the power to make it happen if they wanted to. You don't
need an official statement to see the obvious...

Also I know people who have e-mailed them regarding Atari,
so they know people are still using the stuff.

Seeing as how these are some of the greatest games of all time for the
ST, you're going to have a challenge. You might want to try getting
the DOS version, as it's nearly identical.

Not at all. We gave them an extra special deal too... they just stopped responding to our requests for payment. We did not actually get paid by them for a whole service year and the new one had already started up. Multiple reminders and still nothing. A final reminder, still nothing. The first we heard from them was when we sent them notification that we had shut down their site and emails... too late by then.

Even after the closing down, Cortex asked us to open up the site and informed us that there was no promise as to when payment would be made or even if payment could be made!

Pity that a company like that can't even pay ï¿½60 per year for their web hosting...

4490. SCSI Hard Drives for Falcon

Newsgroup: comp.sys.atari.st
Date: 2000-10-24 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8t55pj$k98$1@nd.eastky.net>
Source record: 55611

I'm in the market for some SCSI hard drives to be used on a
CenTurbo II B version Falcon, and a Stock Atari Falcon.

It has been awhile since I have purchased a SCSI drive, the last
one I bought was a 1 GIG SeaGate.

So I am asking for some advise on what models to consider purchasing.
As I have seen postings that some drives don't work as well as others.

The SCSI hard drives will be used mostly for D2D Recording, CD Images and
storage for creating CDs. And for storage of Large Color/GreyScale Video
using Apex Media/Expose, VideoMaster Falcon. I do alot of Image/Video
conversion as well as Music/Sound stuff.

I need each drive to have around 4.5Gig to 8 Gig of storage Space.

Cecile and HD Driver will be used as the hard drive driver software.

The hard drives need to be 3.5 internal units fast enough to handle
Direct to Disk Music Recording and work well with all brands of Atari
CD creation software. I do not want to use anytype of add on 50pin
converters. So the SCSI hard drives need to be 50 Pin.

I've seen advertisements for Ultra SCSI, Ultra Wide SCSI and etc. Not
sure on which I need or can use on the Falcons.

If you have bought or know alot about SCSI hard drives then any advise
you could pass along as to what Models and etc would be best for my setup
and usage is most appreciated.

Thanks very much,
phantomm@eastky.net

Too expensive for Cortex to afford it would seem!

But the answer to your question really depends on how much space you
want. Quite cheap for the majority of users I would suspect.

Hi Jo.

>CT60 looks like a better design than the CT2, and I'll probably buy one if it appears.
>If it lasts as long as my Afterburner I'll be happy.

If one company is having problems sourcing 060's for its Millan, how is this other company going to fair with its CT60??.

>company... once again.

Okay. Off the top, I was an Atari faithful since 1983, starting with
the 2600 and working up through the XL, XE, ST and Mega ST until, with
a heavy heart, I parted with my Mega ST-4 with custom built
Megafile-zombie in '97. I loved Atari and still do. You're right.

Nothing looked like an Atari. Nothing *was* an Atari. It came from a company who, from Bushnell through Warner to the Tramiels, never ceased to bring innovative products rife with forward-thinking ideas.

That being said, there are an abundance of reasons why a newly revamped Atari would never and could never be profitable enough for Hasbro to look twice at. Just look at the installed user base of all computers on the market. Most of them, myself included, are Wintel people. The remainder own some flavour of Mac. (And in spite of how much Windows continues to degrate from version to version, I still must offer my condolences to iMac users. :-) Anyway, the point is that, in order for *any* competitive venture to be successful, it must offer people something so incredibly enticing that they'd be willing to give up all they've invested in their current product to make the switch to this new one. And make no mistake, any new Atari would be a competitive venture, and it'd be going up against Intel/Microsoft, and Apple, and the sad and unfortunate fact is that these companies have so completely consumed the computer market that any upstart that is not compatible with one or the other is doomed to failure even before it's conceived. After the death of Atari proper, and of Commodore, Intel took over almost whole hog, with Apple nudging in its few percentiles of the market share. In so doing, it ate up the vast majority of the users who were orphaned when these companies went under, and while there would be a relative handful of users who'd snap up a new Atari in a heartbeat, they number in percentages so low as to be far beneath the notice of corporate engines like Hasbro.

Consider this:

1. A new platform needs support. Lots and lots of support from big name companies like Activision, Eidos, Microsoft, Epic, etc.
2. Failing a strong support, it needs to be compatible with existing platforms in order to reap the benefits of an existing support base.
3. A new platform must be on the bleeding edge of technology if it's to have a hope of competing with the likes of Wintel platforms whose every component outdates itself every other hour.
4. A new platform must have something to grab the attention of users whose attention is already bought and paid for by Microsoft. (Corollary: A new platform must look like a Jolly Rancher to grab the attention of iMac users)
5. A new platform must be cost-effective.
6. A new platform must be expandable enough to suit the needs of the individual. (iMac Exception: A new platform need not be expandable, but must be small enough to be transported nasally)

Using the existing idea you've brought to light, we have a PPC-based emulated Atari with existing high end consumer video and audio hard-wired in. Okay, we have bleeding edge technology, but we're sacrificing expandability. Check point 3, scratch point 6. A fast PowerPC 602, say, would be relatively inexpensive as compared to, say, a Pentium III-1.1GHz Coppermine, and the audio and video would bump

cost up another couple hundred. Still, compared to a high-end PC, we sitll have cost-effectiveness. Check point 5. We're using existing Atari cases which are nice looking in their own right, but bear little resemblance to Jolly Ranchers, and only with superhuman feats of physical mutilation could be deposited in any orifice, human or otherwise. Forget the Mac crowd.

Now, what about support? What's there to attract existing developers to jump on board? Or alternatively, what about compatibility with Mac or Intel platforms? Without either of these there's little to grab the attention of anyone. Big question mark on points 1, 2 and 4 -- 4 being primarily contingent on points 1 and 2.

Don't get me wrong, I think the ideas quite cool. It'd be a trip to see what a new Atari could do. But it would be unrealistic to think that it could be profitable to Hasbro whose idea of profitable would be in the millions per quarter. Besides, Hasbro's already stated publicly that they have no intention of reviving the computer division of Atari. Which stands to reason; the only reason they bought Atari in the first place was so that they could pimp a well known brand name around in order to peddle updates to Atari licenses. Hell, when you pay $5 mil for a company, you're not very likely to have much respect for its existing userbase when you could find much more profit in simply using its licenses and its still-recognizable name and logo.

Yes, it _does_ cheese me off. But unfortunately there's precious little to be done about it.

>hearing them before I dispose of it.

The drive's old and stodgy. Your best bet is to replace it with
another MFM or RLL mechanism. They aren't made any more, but you may
be able to find one. Try and stick to the same or similar size --
30-60 megs, half-height. If you go with a bigger MFM/RLL mech, you'll
need to have some wire cutters and a new power supply handy, 'cos the
50 watter in the Megafile 30 won't cut it. I bought a giant 244 meg
full height RLL drive years back, and ended up having to transplant
the guts of the Megafile 30 over to a PC desktop case with a 150w
poewr supply, then snip off the old power supply and solder the new
one in. Worked fine after that -- with the exception that the drive
was very slightly flaky. (Every now and then it sounds like the
platters grind against the inside of the mech for a few moments --

sounds like a buzz saw through metal. I never did find out what that was...)

>during my two-drive experiment? Could the problem by viral and spread
>from one drive to the other?

Viral in nature: No. Viruses need to be executed to propagate, and since you were never able to boot with both connected, nothing was able to do so. Besides, unless there's something wrong with your ICD boot software (or whatever you're using) then there's no way a virus can affect it; ICD just asks the controller what LUNs are present and what partitions there are on each.

1. Re-install ICD Utilities (or whatever HD software you're using) and see if that works.
2. Make sure the dip switches are set properly.
3. Make sure everything's powering up okay. (Fried power supply? Fried controller card?) If you're familiar with a multimeter and have one, this could determine whether or not the Megafile board or the drive's circuit board is fried.
4. Is the drive formattable? (Is it just not recognizing it on bootup, or will your hard drive software not even acknowledge the drive's the logical unit number?)

It is unlikely that simply hooking the two up without touchinng the dip switches would fry anything. Logically, ICD should simply see only the first drive at LUN0 and ignore the second -- or ignore both because it receives responses from both units, which are both set to LUN0.

>
>(3) Are there any new, reliable external Hard Drives currently

You can get an IDE adapter for your STe and use any standard, readily
available IDE drive. This would be your easiest solution.

Sure you can. You can use clusters that have only 1 sector with 512
bytes. So the cluster size is also 512 bytes. This is supported by MagiC
and probably also by MiNT.

> Sorry Uwe - where? I can't find it in my (German) handbook that I got

Yes, exactly.

The GEMDOS limits function is only available in current versions of
HDDRUTIL. I don't think that it is supported by your 7.71 version.

Totally off-topic, but..

1. It was a well-known fact among enlightened europeans that the earth
was round, actually the earth haven't been "flat" since around 600 B.C.
(Pythagoras).

2. Columbus was wrong. Most people estimated the earth's cirumference
to be approx. 40000km - which is pretty accurate - hence the shortest
way to India was by going east. Columbus OTOH believed the
circumference was only 16000km (IIRC), and that it would be faster to
go west.

3. Anyway, how could he have proved that the earth was round? He didn't
reach India...

To sum it up - those who critizised Columbus were correct - the
shortest way from Europe to India is by going east, not west.
Discovering new land or proving that the earth was round was never an
issue, this is probably something Hollywood has tought us.

Hmm, sounds like some computers! Try taking it apart cleaning all the
PCBs, and pressing on all the chips, just repositioning them, can cure
the problem. I can not be of any more help. Sorry.

Hmmm, unfortuantly it sounds like you have. Really things should be
protected from mistakes like that but unfortunatly not everything is.
Unless you take it from the other angle, your STE might have a dodgy
DMA. Look at the chip number on the DMA. Many units were sold and
not fixed of the dodgy batch of DMAs

>Could the problem by viral and spread from one drive to the other?

A virus! We ain't had one for years!

>(3) Are there any new, reliable external Hard Drives currently
>available that I could use with my Atari 1040STe?

I like the IDE interface from Mario Becroft (ASP is UK dealer),
supports two IDE's drive and a 2.5" drive can be squeezed into an

unmodified STe cases. Reliable is it's middle name.

This is true, Vasillis har written "MagiC-Net" (I believe that's what he's calling it) which is binary compatible to MiNT-Net. He already have the XIF-drivers working, and the last I heard from him was that he's writing GEM-versions of the configuration-tools. These will naturally work with MiNT-Net as well, since the interface is 100% compatible.

I think the reason why he hasn't talked much about this project in public is that MiNT-Net is going to get radically changed in the near future (AFAIK it will be a GEMDOS-extension and not a device), and Vasillis is coordinating his work (or perhaps he's just waiting) with Torsten Lang and Frank Naumann.

4506. Re: PowerPC 1040ST...

Newsgroup: comp.sys.atari.st
Date: 2000-10-24 00:00:00 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <sYuNQYD7LV95EwBJ@lovecraft.demon.co.uk>
Source record: 55770

Once upon a time <0bdavs451egoc11dp6p2h38259o96gf7fu@4ax.com>, Mindfield <mindfield@badgers.home.com> grabbed chalk and scrawled:

You know what I'd like to see in a new Atari?

Something 2U Rackmount, with expanded MIDI capabilities (2 in and 4 out, maybe), a slightly faster 68000 or 68030 CPU, slightly redesigned video circuitry that allowed monochrome and colour modes to co-exist using a multisync display, but functionally close enough to allow TOS earlier than 2.06 to be installed for compatibility with older software, an internal SCSI HD, and perhaps options for a 16-bit stereo sampler. Essentially a TT, but smaller. It should have a 1.44 floppy on the front, and cost around ï¿½200 with 4Mb RAM (8Mb if based on a TT architecture). Vitally, it should have an external PSU and be convection cooled. External connections could be replicated on a 1U rack, supplied with a sampler option, but allowing you to connect the keyboard, mouse and joystick at the front as well as feeding line inputs and mic inputs (mic inputs having a small preamp in the 1U port replicator).

That would sell by the bucketload. PCs are too complex for simple MIDI sequencing, you need to waste ages setting the things up, and they rely on what I think of as 'voodoo' technology like USB for their MIDI ports. Something that is basically an ST, but new, a little faster, and able to run the majority of old and new software without needing 2 monitors, and doesn't make any noise, would be wonderful. Lots of musicians still use ST technology because it's simple, robust and generally works (apart from GenEdit's D50 template *growls*) and the software is cheap, so entry level people like it too. More than anything, it's a good way to get started understanding how MIDI works.

If that was released, I'd buy one tomorrow. I wouldn't choose to buy a ï¿½1,500 'SuperClone', because I don't really find the idea of a small production run computer costing three times as much as a decent PC and probably just as likely to run old ST software as a decent PC ;) appealing.

Hi

I was only using this to make a point! I was actually taught that
Columbus stuff at school many moons ago. Although I do agree with what
you have said. I would go a little further and state the Bible mentions
of the Earth being round and IIRC the sun being the centre, so that's
before BC!

Yet again if it wasn't for a fanatic called Columbus the America's
wouldn't have been discovered so early!

I also think there is a market out there of which Atari did fill the
gap, and is still doing so, a decent reliable machine with MIDI as
standard and throw in some easy upgrade option of features like a
quality sampler, real time effects, and yet could be used on the
sideline as word pro/accounts etc.

All in 1 unit that's easily moved around!

Just like the Macs have their niche an Atari machine would ALSO build on
it's little corner of the universe.

I would suggest you to use a midi interface that's separated from the soundcard itself - either an USB- or serial port-interface. Otherwise, it probably won't give you the performance you're after, due to the internal handling in the soundcard. All combined cards I know of have the audio as the main priority, so midi always comes last... As for audio latency - how about my RME Hammerfall's 1.5ms...? ;) My midi interface is a rack unit from Opcode that connects to the serial port. I never have even the smallest glitch or problem with midi or audio - just the superb sample-accurate sync I want :)

Um - no. It may work with *some* cards, but it is specifically tailored to
the needs of an SMC Ultra Ethernet card and is no general ISA interface.

The STE should have "normal" sockets, so a standard PLCC extractor tool
(around 10DM) works fine for these, without the risk of damaging the socket.

Older STs have sockets where there is no real space for the extractor to
hook under the chip, so there you have to use screwdrivers.

There are statements in the Bible that suggests that the Earth is flat as well, but flat vs. round has never been a religious issue. However, whether the sun or the earth is the center of the solar system (or actually universe) was a big issue, but since the Bible really doesn't say anything about this the church didn't have any problems to accept the sun as the center of the universe (and with the planets orbiting around it) around 1800 (IIRC, I learned this in school around 15 years ago...) years ago, when most scientists agreed on this fact. This also means that they had to know/accept the fact that the Earth is a planet, hence not flat.

> Yet again if it wasn't for a fanatic called Columbus the America's

I don't think he was a fanatic, he just wasn't very good with maths ;-)

> wouldn't have been discovered so early!

Ermm... The vikings had a small colony on Newfoundland (or "Vinland" as the vikings called it) about 1000 years ago, so the Europeans had already known about America for several hundred years already. They didn't know much about it though, only that there were land west of Greenland. The settler's tales about the horrible inhabitants of Vinland (supposedly barbarians, cannibals and fierce warriors that killed many of the settlers and destroyed their crops) put most people off, very much like today ;-)

The market is there, but it's already filled. Macs and Windows dominate completely, and it will require huge resources to penetrate this market. Only current Atari enthusiasts, and maybe some of their weaker friends, would buy it.

> Just like the Macs have their niche an Atari machine would ALSO build
on
> it's little corner of the universe.

The Mac has it's band of followers, just like Ataris. However, Apple
has been here since the late 70s, while Atari has been dead since 1993.
It will be very though - if not impossible - to expand the current user
base.

As others have suggested it's very likely that some of the chips needs
to be reseated and possibly cleaned. It's also possible that the PSU is
bad and can't deliever enough juice initially, try disconnecting the
harddrive and possibly the floppy and see what happens. I had a similar
problem with my own MSTE six years ago and remember that I had to
replace a capacitor on the PSU.

Hi,

Does anybody out there have the Mk X case instructions.
I have fitted my Falcon in such a thing. But now I want to make the line level patch to the sound system. I remember that the Mk X case fitting involved changing/removing some sound resistors since it has the cinch connectors instead of the miniplugs. But I can't find the instructions to check if it was something important.

Regards,
/Jonas

>market. Only current Atari enthusiasts, and maybe some of their weaker
>friends, would buy it.

That's what almost everyone in the world thought... before Linux arrived
in the public eye.

You turn TOS/GEM into yet another alternative Mac and peecee OS, and I'd
bet more people than current Atari enthusiasts would be interested
(especially if the barrier to entry was almost zero, one of the big
draws of Linux).

In answer to an earlier remark that, maybe we don't want the Atari idea
to spread - how could it hurt? How could it do ANYTHING but help? The
big problem in the Atari world is lack of applications, specifically web
browsers that are up to the job, and this is directly a function of how
many developers are interested in a platform and how many potential users
(purchasers?) there are. The current Atari world can't support much
any more. Open the borders!

Hopefully, some of these new/ported apps would be recompiled for 68K,
and benefit the legacy Atari hardware segment!

Another point: Someone was commenting (negatively) that yet another
alternative Mac and peecee OS wouldn't have a chance in a market already
deluged with such. I agree that there are lots, and more appearing
every day. Most of these, however, (almost all of them, in fact) are
Open Source or homebrew projects, from scratch with no history or
"baggage". The fact that the TOS/GEM has quite a bit of history (and
a bit of excellent "baggage" that would require an emulation for the old
68K binaries) would be a mark supporting its success. Do WE think TOS/GEM
is a cool thing? Surely some/most of us here think so, and that's why we
stick with it. Surely other people would think so, especially if they
could try it FREE on their currently-owned hardware.

[By The Way, I include myself among those salivating over the idea of a
real PowerPC Atari successor (unique and superior to the Mac hardware),
but realistically agree that there is almost zero chance, with the
history of Phenix, Wizztronics, and Milan (and the defunct Canadian
outfit, with the, what, x40 and x60, what was it?) behind us, of such a
wonderful beast actually appearing. Even the POP idea is slim, since it
would require a ported TOS, and we saw from Milan I what a chore THAT is.]

The best solution is a TT ram card that takes PS/2 SIMMs. The AixTT or the
newer MagnumTT should still be available, eg. from Woller Systeme.

The AixTT can take up to 2 32MB SIMMs, the MagnumTT up to 2 128MB SIMMs.

Show me where they have publically stated that they refuses to restart the computer division. And, people keep forgetting that I would be offering to have a company under their helm with NO involvement (manpower, time, or effort) from them, except that it would be their company. All we're asking is they help get it started. They get their money back out of it and then we work hard to make Atari make MORE money for them (Hasbro). Naturally, we have to produce a reason to buy this unit to the existing user base, plus any already drifted persons (like myself and many others).

For me, since I don't really use a computer for work, but more for browsing and play, having an Atari system would be like reliving the past a second time... except this time, WE'D be running the show. Not corporate blenderheads who see the consumer as nothing but financial numbers. We'd make user feel like they matter to the company, just like Be, Inc. did in the beginning, but it wouldn't stop. Sure, Hasbro could tell us to go in a direction we didn't necessarily want to go in, but that's a risk we HAVE to take if we are to ever bring Atari back as a computer company. They could pull the plug. They could tell us to do something that we thought was totally rediculous. We could fail horribly and die only months down the road after the initial user base had been filled. Anything bad is possible, but the chance to try to do something Hasbro themselves never will (Like start up Atari as a computer company again) is a chance I want to have. Really, really bad.

The best we can do is lay out the plan of action, show them the prototype system, show them the buyers we've gathered (and that's gotta be a lot right there), the programmers, the retail outlets willing to sell the units and the advertizing plans we have in place. Show them how much it will cost them to start us (Atari Computer) up and then show them how easily they will get their money back and how much (and how) we can get after that point.

We would have to sell the systems high enough to get Hasbro's money back and help build up a substancial profit base to work with (and pay employees; all Atari enthusiasts like myself), etc. et al.

I mean, If Hasbro has nothing to lose by helping us and could potentially gain millions of dollars as an unattended division of their brandname, why should they say no?

Not doing anything, gets us nowhere. Not trying makes us failures from the start. Sure, you could build a PowerPC clone (RioRed already is), but you're serving a dying market, because the energy of "Atari" is no longer there. Nostaligia can only run so long before people stop caring.

But if Atari came back and started making computers again... you begin to revive the energy engine. Give hope back to those that stopped hoping and

moved on. Give someone a reason to be a proud Atari user again!

And for those who HATED Atari for burning them? That was then, this is now. Who better to know what WE want as Atarians than fellow Atarians (and give us what we want)! Hasbro won't do it.

I mean, just how excited would you be to see an ad on a cable TV channel(regular TV would be WAAAAAY to expensive) showing that not only was Atari back, but a new computer that looked like an old one was completely revamped and improved, with software support being restored and the systems being made? It gets me excited just thinking about it!

I've got ad ideas. I've got video ideas up in my noggin'. I've got the enthusiasm. I've got the willingness to try to do the impossible. But...

One man can NOT accomplish this by themself. It involves too many components and skills to do alone. System (motherboard) design and layout. Internal parts (what main/secondary storage medium do we use? Do we go with USB? What do we keep and what do we dump from the old system?). Advertising ideas and costs. Programmer aquisition (we're gonna need 'em!). Case design modifications (if several items are dropped from the ST (floppy port, HD port, etc.) , we need to have sketches of what the modified case will look like). Buyers willing to put a down payment on their new system. Cost of the parts, manufacturing the motherboards, making new cases, new keyboards, employee assignment, etc.

No one is saying it will be easy. But if we never try, we have already failed miserably.

I mean, lets find out how much it will cost and what manpower is involved to make just ONE of these modified ST's. Then, we can work on the other stuff and get a full picture going. Then, when everything is just right and we're completely ready, we dump the truckload of our efforts on Hasbro.

I mean, if you think about it, all we're doing is presenting a well-thought out business plan for start a company with someone elses money. Should it matter that it's Hasbro or Atari we're talking about? No. And, when you have physical evidence (the modified ST) as part of your business plan, I think that speaks even better than just words on paper. But the fact that it *is* Hasbro and Atari we're talking about is what makes it special to us.

We can sit here and wish it were all different. That Atari wasn't dead. That Hasbro would do something more with Atari. But guess what... it'll never happen. What we're doing is trying to change that.

We might succeed and we might fail, but how much will it take to at least TRY? If we all pitch in our talents and abilities and finances (what little or as much as they might be), who knows what we might accomplish?

I mean, did David cower at the sight of Goliath? No. He slung his stone and sunk a hole in one! But, while everyone else was cowering and saying it was impossible, David went out, with FULL conviction, and accomplished what no one thought could be done. He KILLED Goliath! Beheaded the godless

bastard! And David became a king!

Who is to say we can't do likewise in our own efforts? Hasbro? Others? We can believe what we want and we oft believe what people tell us, based on what they have experienced and experiences with other companies, but...

Peter walked on water (an impossible thing in and of itself) because he believed in Jesus. Even if for just a few steps. But he got out of the boat! He DID walk those few steps! What if he had never tried? Where's the testimony in that?

I use biblical references only because they seem like good examples of my point. Not trying to start some religious fervor... though some might think my insitance of this dream of mine is nothing less than religious fanaticism (which I must admit it is, to some degree, because I so enjoyed those bygone days of the mid to late 80's).

How many here want to help? how many here have the time to help? How many here care? Surely, this isn't the only newsgroup that we can get help from. What about past Atarians that could be found in other newsgroup? The PC and Mac newsgroups may even have more potential followers than even here!

But we've got to try if we are to even know if it IS possible. And, what if Hasbro, with all the facts before them and the prototype system on their desk, turns us down? At least we can say we did our best. We return everyone's downpayment, and we go back to our lives. And I could live with that. The best we can do is the most anyone can expect of us. Hasbro is their own company. They can make their own choices. We can't change that. But, we can surely try to bend their arm a little...

And that's what it's all about... TRYING!

Jared

Right. I am using the
http://www.elsa.de/PRODUCTS/LCDSLI10/HOME.HTM
router at home - works fine with all my machines, including the Milan.

I'd like to point out that TOS is already a open source experiment(?)
It is called MiNT.
or as kellis would have said
MiNT is Now TOS, let's move on, shall we.

well the thing MiNT has all over Linux is installed base of
applications.
There are *tons* more applications that will run under MiNT than there
are
under LiNUX.
The ability to run atari apps on any hardware(well, most
hardware=x86,PPC,68x)
is an attractive idea.
port over 'device drivers' from Linux68k, Linuxx86, to MiNT so that it
starts
off with some capabilities of handling exisiting hardware(soundcards,
MIDI ports,
HDdrivers, serial,...)
_I_ can't do it, but maybe someone can?

4527. Possible Mighty Sonic Falcon Auction

Newsgroup: comp.sys.atari.st
Date: 2000-10-24 00:00:00 UTC
From: Mike <magicmac@my-deja.com>
Message-ID: <8t4igfgmt1@nnrp1.deja.com>
Source record: 55791

The old doctor has taken a little more from the check book this year
than normal, and decided that one of the Falcons has to go.
I'm not going to quote any prices, and will not be taking offers here or
by email (unless there to good to be true;). Just kind of feeling the
waters to see if anyone is interested before I go through the trouble of
putting it on Ebay. I will answer questions about the machine.
(email rustynutt@hotmail.com). I don't check Deja email. I will not
respond to emails containing questions like "how 'bout $100.00 and you
pay shipping, or how did you get this to work, my machine....leave that
for the newsgroup.
Sorry to babble about personal stuff... I hate to see it go.

Atari Falcon 030
C-Lab Mark X case
Mighty Sonic Accelerator with 32mb of TT ram (expansion port card with
it's own PGA 50Mhz 68030, like Afterburner).
Nemesis running at 40Mhz (no more or no less)
Wizztronics memory card with 4mb simm
Nova ATI Mach 64 Video card
1.2gb 2.5" IDE
Mega or TT keyboard (not sure what it is)

It's a quick, reliable, compaTTible machine in good condition. It's also
a very tight fit inside the case with all the hardware. Runs TOS and
MiNT very well, surf the net 1024*768 16 bit color. I will leave an
alternate O/S installed on the machine, and necessary drivers, but won't
be specific about it. If you want software, go buy it. It's not free
with this machine. I would recommend a user experienced with Atari
software and hardware for this machine. Look for it in about 10 days on
Ebay.

Thanks,

Michael Grove

No, but this wasn't the point. The point is that OSIS isn't a
self-contained OS, it's a emulation-layer on top of Linux.

Yeah, but Linux runs on the same hardware as Windows and MacOS, so it
doesn't require any investments from the user. I was refering to custom
hardware.

> You turn TOS/GEM into yet another alternative Mac and peecee OS, and I'd
> bet more people than current Atari enthusiasts would be interested
> (especially if the barrier to entry was almost zero, one of the big
> draws of Linux).

Precisely. I doubt that the userbase would grow, but OTOH it could prevent
it from shrinking. And the current ST-users could switch from basic TOS-
or MagiC-setups to more demanding configuration, this will make it easier
to write more sophisticated software or port stuff from other platforms.

Looks like the subject line changed a bit too much for my reader to catch Dan's take on the subject. He beat me to it!

However, I get the impression that the PowerPC Open Platform "movement" predates and transcends IBM's free engineering contribution. The North bridge problem stalls new designs based on IBM's work, but not others. It isn't clear that RioRed inherits from the IBM design, but it's been a while since I looked. Uhh, just looked, no, RioRed is not based on IBM's work, but still uses a North bridge. Could be why nothing has happened with RR since January (to all appearances).

Hmm. Maybe though, spreading is a bad thing? In all seriousness, there is a principle at work here, where something is only truly worthwhile, when it doesn't gain widespread use. Think of it as a beautiful pristine beach, untouched by man. Visiting it is like a glimpse of heaven. With just a few that know about it, it retains most of its greatness. But if it turns into just another beach, like the ones where 15,000 visit is every day, and you can't take 2 steps in a random direction without stepping on someone...

Usually, when people think of "flourish" they imagine something that might be betterr called "dominance". We don't need that. We just need it to not die, and to be somewhat healthy in the meantime.

Besides, there may be room for only one cross-platform OS. Certainly, there is only so much room, for this sort of software. Unless you want TOS/GEM to become just another Xfree86 skin, I suggest we don't worry about half measures like this. We just need to see that there could be another way to do this. We don't have to wait for someone else to build the hardware.

much there already...

> survive the demise of a parent company? Getting original Atari TOS source
> and maybe Atari DR GEM source released to the public domain? (ha ha) Maybe

Hopefully these sources are lost forever. If they should turn up sometime,
we should burn the disks ASAP, going 15 years back in time isn't exactly
what we need.

Why the Falcon, the worst ST-compatible (sort of) ever built? Take the TT
instead, throw in some ISA- and PCI-slots, a 060 and... wait, that's
already been done.

> fixing known bugs (rather than experiencing new ones with a new design)
> would be considerably cheaper than designing from scratch.

Nah, building a PCI-motherboard should be a lot simpler than fixing the
Falcon with all it's flaws. E.g. you'd have to make it a 32-bit computer,
this means redesigning all the custom-chips.

> hosting...

In that case their market must be really dead - or maybe they are parasites
who want others to pay for them? :(I wonder how they can expect to
continue with any business at all when they can't even pay ï¿½60 per year...
Even in my very small spare-time company, I could afford that without any
problems.
Not paying for a whole year (in spite of a good deal) - and still expecting
to get webhosting for free from the same host? Then they don't deserve
another chance!
There are free webservers out there (my site's on one of them for the
moment) - but to get a useable address, they'd have to pay for a domain name
and a forwarding service, which they probably wouldn't afford either...
Just some thoughts...

The fact that the world is round was widely known from the time of the
ancient Greeks (who even managed to calculate its size). The Vikings had
discoverd America long before Columbus, and settled in parts of it. The
existence of a continent "over there" was common knowledge among Irish
and Scandanavian seafarers. In his trips to drum up funding for his
expeditions, Columbus no doubt heard these tales. If Columbus had not
stumbled across the new world 1n 1492, sooner or later,someone else would
have. Columbus was just lucky to have been swimming with the tide of
human discovery, so he gets remembered.

The world moves on, leaving flat earthers behind. There's a lesson there,
alright, but probably not the one you were wanting.

Ultra SCSI is no problem at all. For Ultra Wide an adapter is needed.

Either by finding someone who can and will port the OS itself to a new
CPU, or by running it on top of a 68k emulator.

There is a reason why this concept failed almost ten years ago - it's
too expensive and difficult to upgrade and repair it. And if you
consider the various accelerators and graphics cards that people add to
their Ataris, you'll see that this concept will also fail today. People
want to upgrade, and they want it *now* and not in a couple of years.

>Is it workable?

I think so. After loking at it, I designed my own SMC Ultra->VME adapter
which basically works the same (ie. Ulrichs original driver works with my
adapter), only in a more optimized hardware design. The adapter works fine
in my TT with the TU Wien TCP stack, however, because the TU Wien stack is
outdated (I fixed several bugs and got it working under Magic some time ago,
but upgrading my server to a newer linux verision broke it again), I do not
use it currently.

There is no *single* "standard" SIMM. SIMMs are standardized ba JEDEC, and
there are several flavours.

Most common are the old 30-pin and the newer 72-pin (aka PS/2, since IBM
started using them first in their PS/2 machines).

Most atari RAM cards I know require correctly wired detection lines, but
since JEDEC requires these, any SIMM that lacks the detection lines can be
considered broken, even if most PCs and the Milan ignore them.

The first link only returned a "Internal server error", but the second works. This "professor Barry Feld", is this the same man as Barry Feld, the marine biologist who wrote "America B.C."? His theories are - to put it mildly - controversial, almost up there with Erich von D�niken and other pseudo-archeologists. However, it's almost ten years since I last tried to catch up in this area so my information is quite possibly outdated.

Btw. if you're seriously interested in the history of North America and all the myths surrounding it, you should read professor (in American archeology, not marine biology ;-) Stephen Williams' book "Fantastic archaeology".

Anyway, this is slightly off-topic so I suggest that any further discussion should be moved to private email.

Not sure what "cablenet" is - the router does DSL, ie. PPPoE (with the DSL
modem being supplied by the telco).

If you want to connect more than one machine, you also need an ethernet hub.

Yep, you're gonna have to prise F1 Grand Prix off me with a crowbar.
I have to say it's one of the best games I've ever played on any
computer to this date.

I even modified a steering wheel controller to have all three pedals
and I used an old C64 joystick as the gearstick. Everything worked
like a real car; you could only change gear when the clutch was down.
All done by a bank of relays!

True - and they certainly got titan-bss.couk through us which we handle..
however they will be lucky transfering it away to another host as our
contract/T&Cs do state no domain transactions will take place until
amounts are paid in full...

Hi!

I've had my Mouseburster for well over a year now, but the mouse supplied (Ice Mice) is really poor. I've never got round to getting a new one so a couple of days a go I bought a Pilot Mouse from Logitech.

It came with a PS2 connector (6pin mini din) and a convertor for a 9 pin type connection like the one for the Mouseburster.

I've been trying to get it working but it fails to do anything. On a PC 386 laptop I got it working. I've also got a microsoft mouse with a 6pin din, like the Logitech.

This is a basic table I made by checking what mode the mouse is in. (MS=Microsoft mode SY=Mousestystems mode)
Logitech Microsoft Ice mice

9pin (DB) SY SY MS/SY*

6pin (mini din) MS SY /

*=the mouse is able to boot up in any mode by holding a button down on boot up.

The mouseburster can accept SY mode _or_ MS mode so I can't see why it doesn't work, by switching a DIP switch. Is it something to do with the Mousebursters (probably) non RS232 standards?

I'd really like some help, because the shop refuse to take back the mouse, because to them, it ain't broken. But nothing on the box has any technical details, and the people who work there didn't know what I was on about. PC shit.....

Sorry about the longish post but things like this need good explanation.

>encompass?

This is used for DSL lines, like those offered by Deutsche Telekom, Arcor
etc..

It's called PPPoE, which stands for "PPP over Ethernet". Basically, you get
a DSL modem from the telco which has an ethernet jack. But since this is a
dial-up line, you have no normal ethernet protocol (with ARP etc.) on this,
but a special PPPoE layer which handles the connection to the telco's access
concentrator, with a more or less normal PPP on top of that.

So the ethernet interface is basically used as a point-to-point link (just
like a serial cable), and only one active device can be attached to the DSL
modem at a time - either a single PC (with PPPoE driver), or a PPPoE-router
with NAT.

Upgrading one's computer when you don't NEED to upgrade is pointless and a waste of money. If your video card hardware and RAM have yet to be fully used to their potential, then you waste power just for the sake of having more power. Where's the logic in that?

I dare say a new Atari system, based on 32Mb of RAM and a good video chipset with 4-16Mb of RAM could easily last a year or more, if people would exploit it's capabilities and get out of the "keeping up with thre jones" mentality we're all so friggin' stuck in.

Why do you think that the Atari ST's were so expoited with demos and programs that took it beyond what it was designed to do? Because they HAD to! They couldn't just pull out the RAM and video card and stick more in. They had to make use of what was there and they did...

How I loved the CareBear demos and Enchanted Lands and some of the other apps that really pushed the envelope with the ST. And I strive to bring those days back, if at all possible.

"Waste not, want not", as the saying goes...

Jared

Hi All,
I would like some suggestions on what wouldbe the best route to take to re-case my Falcon. I want more space so that I would be able to install a 3.5" IDE hard drive and an internal IDE CDRom drive.
I'm thinking either the DeskTopper case or the MarkX case.
Any suggestions?
Thanks,
Sam Ferrer

4559. Format a Syquest for both Atari and Mac?

Anybody know of a way to format a Syquest EZ135 disk so that a Mac and
an Atari can read it?

> hard drive and an internal IDE CDRom drive.
> I'm thinking either the DeskTopper case or the MarkX case.
> Any suggestions?

Of the two you mention, the DeskTopper has
the most internal space, but it's also rather
schoolboy-metalwork-project in appearance
and does not entirely replace the Falcon case,
only the top half. It has two 5.25" openings at
the front, one of which will be used for the FDD.
The DeskTopper is also awkward in the extreme
for maintenance and will have you pulling your
hair out when you need to change things. It's the
most convoluted and flimsy design I've seen.

The MKX will hold:

1x FDD
1x 3.5" internal device or equivalent removable
(SyQuest, Iomega)

With a bit of engineering, it will hold 1x 3.5"
and 1x 2.5" internal hard disks.

MKX has less space, but if you don't insist
on using interal ATAPI CD-ROM it'll do nicely
and is far better in terms of accessibility.

The other alternatives are the SoundPool
Digital Audio Workstation rack and
Lighthouse Space Case. The SoundPool
is the better one (quality). It'll also hold a
3.5" hard disk (plus a 2.5" if you drill a few
holes, easy), FDI digital audio interface and
MO 4 MIDI output expander. Neither of
these will hold a 5.25" device (the Space Case
has two 5.25" openings but the top of the
case "steps down" and prevents CD drives
being fitted because the back of them hits

the metal) but both are more industrial than any of the others, being professional 19" rack-mounts.

All of these cases are available from System Solutions in the UK.

I don't know the exact English word for it. It is Internet through cable
televion.
I only knows that it requires some kind of special modem, provided by the
telco and an ethernetcard. A while ago someone told me there exist a
MiNT-net driver but this requires a static IP address and this is
something the telco won't give me.

The point is, that while some people might be happy using the same
hardware and software for years, most will upgrade both. And as software
gets more complex, the hardware must keep up. Atari-owners in particular
are desperate, you would have known this if you had used an Atari after
1993.

> I dare say a new Atari system, based on 32Mb of RAM and a good video chipset
> with 4-16Mb of RAM could easily last a year or more, if people would exploit

Who would by a very expensive computer that only lasts a year and can't be
upgraded?

Btw. I have a Falcon with a 040, 68Mb RAM, 4Mb ATI graphics card, a Yamaha
GX-card and a CD-ROM. So why do I want something faster? The answer is
very simple: I want to do more things with my Atari, but currently it's
not fast enough. When/if I get a 060 with even more and faster RAM, and
perhaps a faster graphics card, I'll be satisifed for a while, but then
I'd want to do even more things, things that a slow 060 with only 256Mb
RAM can't do... That's how it works.

> Why do you think that the Atari ST's were so expoited with demos and
> programs that took it beyond what it was designed to do? Because they HAD
> to! They couldn't just pull out the RAM and video card and stick more in.
> They had to make use of what was there and they did...

And why do you think all of the old democoders have moved to the PC, or
atleast newer Ataris?

> How I loved the CareBear demos and Enchanted Lands and some of the other

The Carebears write Java-apps today.

DOS formatted disk can be read by Mac and Atari. On Atari side you need an
OS such as FreeMiNT or MagiC. If you don't have one of these OS'es you can
always use BigDOS.
Another possibility is HDDriver. With the latest version of HDdriver one
can partionate disk DOS/TOS compatible.

I suspect it's the way PS/2 is converted to Serial. It might have something
to do with transfer speed, as I believe the
PS/2 port is much faster.

Maybe either Chris Crosskey or Mario Becroft could help you better?

FamilyNet HQ: Telnet:\\www.family-bbs.net

I figure since it will be a few days before I get the pictures online for auctioning I would make this available to folks here. If no one here needs it I will ebay it.

The Atari TT care package:

Parts Atari TT consisting of....

Motherboard (non working but there for various parts... I know the power supply for example, works)
TT casing (I know of some TT and Mega STE users who have been looking for a replacement case)
Hard drive case housing

2 MB RAM card in the box. After checking around I found this is the style of 2 meg ram card that could be upgraded.

If interested, drop me a note and make an offer. Best offer gets it.

Btw. why is it that the final step with MiNT was never made, so that
it still needs the underlying TOS a little (something of XBIOS,
isn't it?). AFAIK Magic, for example, doesn't need TOS at all, so
it seems quite feasible (technically) for MiNT to do the same.

I suppose some people say the same thing about Windows.
The problem with iConnect is that it was invented last of all existing stacks,
yet is incompatible with every one of them, and has not even got a public API
(AFAIK).

Well, 95% of all SIMM-using hardware will use the same type, as long as the
number of pins is the right.

>Most common are the old 30-pin and the newer 72-pin (aka PS/2, since IBM
>started using them first in their PS/2 machines).

Mind you, IBM PS/2 machines won't use "standard" 72-pin SIMMs, but require
particular 72-pin SIMMs with speed and size detection lines which are not in
place in the SIMM you commonly buy at the computer shop.

>Most atari RAM cards I know require correctly wired detection lines, but
>since JEDEC requires these, any SIMM that lacks the detection lines can be
>considered broken, even if most PCs and the Milan ignore them.

I'd rather consider the Atari cards broken, since they then refuse to accept all
SIMMs I have, spare for my 2 precious IBM ones.

I have a list of HD's that work with Cubase Audio on my site. I don't have
many of the currently sold drives there though, since I haven't received
many reports lately from users :(
***Please send such reports to me as soon as you've tried a new HD with the
Falcon and CAF!***
For the HD recording, make sure you read the "About the Falcon"-page, as
well as the "Troubleshooting"-page on my site and you'll get some useful
hints about what to do and not to do...

> Cecile and HD Driver will be used as the hard drive driver software.

HDDriver is absolutely THE way to go.

> The hard drives need to be 3.5 internal units fast enough to handle
> Direct to Disk Music Recording and work well with all brands of Atari
> CD creation software. I do not want to use anytype of add on 50pin
> converters. So the SCSI hard drives need to be 50 Pin.

If you want to use CAF, you need to be able to read 40MB/minute to replay 8
mono tracks of audio simultaneously, which is actually below 1MB/s, so just
about any modern drive is up to that - as long as the fragmentation isn't
too heavy... The Falcon's SCSI interface has a hardware limit of 2MB/s
theoretically (which is never the same as in real life) and with HDDriver
you'll get very close to that - I managed about 1.9MB/s in my setup.
CD-writers need bus-arbitration and many of Quantum's models can't be used
with CAF with arbitration on, while they need arbitration on if you want to
boot from them :(To make a long story short: Avoid Quantum!
I had problems when trying to use a Fujitsu 9.1GB drive, but that was over a
year ago - maybe later versions of HDDriver has seen to it that it works
now...?

> I've seen advertisements for Ultra SCSI, Ultra Wide SCSI and etc. Not
> sure on which I need or can use on the Falcons.

I've tried a Fujitsu Ultra Wide 4.3GB and the only thing you must do is to
add a very small adapter between the drive and your 50-pin ribbon cable, so
that doesn't seem to cause any extra problems.

> If you have bought or know alot about SCSI hard drives then any advise
> you could pass along as to what Models and etc would be best for my setup
> and usage is most appreciated.

TO EVERYBODY: Please let me know about all harddisks you've tried, so I can add more CAF compatible drives to the list on my site and that way make a constantly updated contribution to better Atari support.

hardware
> modification part of the CAF Manual?

Yes, almost...
I believe there is a component value that's different, since the description in the CAF manual actually didn't give the standard -10dB level, so I believe you should check out the site, lazy or not... ;) I don't have my CAF anymore since I moved on to VST/PC and made a cross-grade, so I can't check which one is different.

If you scan the SCSI-bus with HDDriver's scan function, you'll see the model
in the list and then you can compare it to the list of recorders compatible
with SoundPool's CDRecorder: http://www.soundpool.de/writer.txt

> just wondering which is the most powerful between the Falcon and TT
> since they are both based on the same processor.

The TT has a 32-bit bus and a double-clocked CPU, so in this respect it's
a lot more powerful than a Falcon. The Falcon has much better graphics and
16-bit stereo DMA-sound though.

> it seems quite feasible (technically) for MiNT to do the same.

But then it took ages for MagiC to support the Milan or Hades, which it
supports by doing the same as MiNT does - using the existing
TOS-routines. When/if MiNT becomes 100% self-contained you must also have
people to support all the different machines.

Perhaps 95%, but you can still find SIMMs that aren't of the correct type,
the VSIMM for Mac LC is 72 pin and doesn't work, same for a HP 700-series.

Well, then those SIMMs are cheap crap. I have Kingston memory, and that
works just fine (and they were bought in a common computer shop).

> >Most atari RAM cards I know require correctly wired detection lines, but

I wouldn't say broken, they just conform to the standard. If your SIMMs
doesn't work, then just fix them! Most of the cheap SIMMs that aren't
wired correctly have a couple of solder pads on them so that you can wire
them however you feel like. Just use a solder iron and be done with.

Hi!

In comp.sys.atari.programmer Jo Even Skarstein <joska@nvg.ntnu.no> wrote:
> The Falcon has much better graphics and 16-bit stereo DMA-sound
> though.

Not to forget its DSP, which enables the Falcon to do things the TT
won't manage, like playing MP3s at a decent speed. Of course, you need
special software that supports the DSP.

Ciao

Thomas

I thought the VRAM SIMM was 68 pins, but that was perhaps GVP SIMMs. And the
IIfx SIMMs.

Well, Kingston builds SIMMs for most every system produced on Earth. They even
make monster DECstation SIMMs.

Thanks for checking it out, I have looked at the site
http://ds.dial.pipex.com/electronic_cow/cownet.shtml and it is now freeware
as is all Electric cow products (a noble gesture) , while looking like a
handy midi tool it has no lyric display features at all, perhaps it would
make a good backing track editor /player but sadly not a karaoke machine.

Let's see if I understand you correctly:

We take a DSL service, which gives (or sells) you a DSL modem. The DSL modem uses the PPPoE protocol and provides data over an ethernet jack (10b2?) to the ethernet card (or adapter in the case of the Falcon/TT). This is read by STing?/MintNet? in the same manner as a standard serial PPP connection.

I think I'm missing something.

Lonny, could you post details of your transaction (contact person, address, what ordered, cost, etc.) please? I'm starting to think that I'll have to go the Hades route too, although the cost is pretty impressive. A Milan I with 060 card or MagicMac would also fit the bill, but I'm having trouble verifying these items even exist with English instructions anymore (and I'm not yet so desperate that I'm taking German classes!).

I believe you can do this, provided HD Driver was the formatting
software.

A cruder workaround would be to only use 32Mb and smaller partitions.

This is a CPU-to-PCI bus interface device. However, now that I just took another peek at the IBM POP schematic, I don't see "North Bridge". I see "MA Aureate GX". The schematics are dated Aug '99. So now I'm confused as to what the hold-up really is.

>I'd like to point out that TOS is already a open source experiment(?)
>It is called MiNT.
>or as kellis would have said
>MiNT is Now TOS, let's move on, shall we.

Yes! I've been hoping to get into MiNT for a while now, but have so much else on my plate that anything but a Red Hat-style installation-for-dummies for MiNT would be hard to accept. I keep seeing slow motion in this direction by FreeMiNT (or is it SpareMiNT?), but it is... slow...

What isn't clear to me is, how much is MiNT a REPLACEMENT for TOS, versus a SUPPLEMENT to TOS. Obviously, it doesn't run anywhere else but an Atari machine (or emulator on another platform). Could MiNT run without real Atari TOS somewhere in the background? If so, it should be possible to port MiNT to peecees and Macs (in the very same way Linux has been ported from Intel to PPC and Alpha, etc.). If not, if real TOS is still required, then the MiNT people must overcome this dependency for the Atari hardware replacement strategy being argued here can become a possibility.

>well the thing MiNT has all over Linux is installed base of
>applications.
>There are *tons* more applications that will run under MiNT than there
>are under LiNUX. The ability to run atari apps on any hardware(well, most

>starts off with some capabilities of handling exisiting hardware(soundcards,
>MIDI ports, HDdrivers, serial,...)
>_I_ can't do it, but maybe someone can?

Nor I. I've got x86 linux running, and too many projects of my own. Sounds like a job for some MiNT/Linux68K people (I'm sure there are a few).

And this would be a fine start. Wouldn't run on anything but a 68K Mac, but then PPC would follow (is there an open-source 68K emulator for PowerMacs?), and eventually an Intel port. Probably the Intel port coming first would speed things along faster, since there are a lot more potential developers for MiNT on Intel than there are for PPC, much less 68K.

Sorry about that ;-). Seriously, though, Civilization for the ST is
about as easy to find as a beautiful intelligent heiress. It exists,
but tends to be almost impossible to obtain. On the other hand,
Civilization for DOS is $2 US on Ebay. I occasionally buy games for
other systems when there is no Atari equivalent available.

It's an interesting review, although Babelfish cuts out halfway
through. Does anyone have an idea how easy it is to obtain and put
together a Milan I with a 060 card? I didn't know until yesterday that
there WAS a 060 card.

Your English takes a little interpreting, but...

... your STe probably has TOS 1.62, which has a limit of 256MB per partition. You could add TOS 2.06 and get 512MB partitions if you wanted, and you could add software (such as Mint) to get larger partitions, but you couldn't use those partitions under standard TOS. If I'm correct about you having TOS 1.62, a 1GB drive should be plenty. My STe currently has a 270MB drive and a EZ135MB removable drive attached, and I'm rarely low on room since "archive" type stuff goes onto one of my 10 EZ cartridges.

It's quite difficult to find a new drive today under about 4GB. If I were buying "new" equipment today, I'd get a 1GB drive off of Ebay (roughly $25 for the bare mechanism, which you can put into your existing case) and I'd buy a ZIP or CDRW for archiving ($100 for ZIP, $300 + software for the CDRW). I have three devices on my Link 1, so I think you'll be O.K..

As for specifics, you want "Narrow SCSI" (1, 2, or ultra), you should probably avoid the Western Digital brand. Two final notes: Test your HD case's power supply (it might not be the drive that's bad) and if your STe doesn't have 4MB of RAM, you should get some immediately.

Clones will only go so far before they peeter out completely. How far do
you think you can hoonboggle TOS/GEM before it's so patched together nothing
works right?

I offer a chance to change all that. We start fresh, port GEM to PowerPC
(an effort which, regardless of my ranting, seems like a task someone would
find interesting and worthwhile regardless of the ends, but apparently not),
redesign the motherboard, write an ST emulator, slap it all together, and
present it to Hasbro... along with a solidly throught out business plan.

I've currently been doing some research today on parts and PCB fabrication.
Assuming a motherboard four layers deep (don't know if that's necessary or
not), I saw one site saying it would run about $500 to do a prototype. I
sure hope that includes parts soldered on it...

The prototype is always going to be the big expense. After that it gets
cheaper.
It's not that it can't be done. It's that no one seems to friggin' care!
No one seems to want to stop living life with a "has-been system" (old
Ataris and clones of the same) and work on building and selling an "is-now
system".

I tell you, if I had the money I needed to do it, I'd friggin' do it myself!
But even if I can get the hardware made myself, it's not possible for me to

do the OS. I'm not a programmer.

As a final offer, I state the following:

IF I could get the prototype motherboard done myself (of course, I need enough people to agree with me on a hardware specification list for this), who here would be willing to rewrite GEM for the PowerPC processor (the system, more specificially) and write an Atari ST emulator for the system?

I may be crazy for trying to do what everyone here thinks is foolish or a waste of time or not worth the effort, but, by golly... I still wanna do it! If we fail, we fail having at least tried. Not given up just because everyone else says it can't be done or it's silly to even attempt. I really hate doubt and lack of a willingness to go out on a limb... look at Rudolphe Czuba. Look at Milan. These are people and companies that have gone out on a limb to do what they felt had value to do. I, however, believe they have failed because they are taking legacy into new heights of legacy. And when the horse has been dead awhile, it's not too likely propping him up on stilts and giving him a fresh coat of paint is gonna make him go anywhere very soon.

When will you people realize that working at a dead end is NOT going to get you out of a dead end! Turn around, for crying out loud! Get out of the dead end and let's get back on the road!

But, I fear I am screaming in the dark. Yelling for all the wind to listen to. Speaking to deaf ears. Trying to show vision to blind eyes. Etc. ad nauseum.

All I'm trying to do if offer a new lease on life for a system and company that didn't deserve to die so ruthlessly. And all anyone seems to care about is following wherever the lead dog goes (never choosing to do something radically different and keep the REAL Atari alive) and refuse to see that perhaps the dog is blind and heading straight for a cliff! *sigh*

Where is someone that will listen? Where are the people who actually care? And when will I stop caring enough to actually shut up about all this so you people can get on with your miserable post Atari lives?

Would any of man's greatest accomplishments ever occured if they listened to others who thought it either impossible or dangerous to even do so? NO!

> And why do you think all of the old democoders have moved to the PC, or
> atleast newer Ataris?

What newer Ataris? I thought that's what I was trying to do! You mean someone has actually revived Atari and built new systems? Are they PowerPC? Are they fast and exciting with lots of new software I can go out and buy?

Oh, you mean THOSE "newer Ataris"... uh, sorry, not by my definition... If it ain't got the fuji and it ain't got the name and look... it ISN'T an Atari. It's a hackjob clone. And "Homey don't do that..." ["In Living Color" reference]

> The Carebears write Java-apps today.

I wonder if they're as exciting as their ST demos...

I ask you... any of you... with some spare time, if any, on your hands...

How much would it take, in time and effort, to:

1) work on designing a new 1040ST-sized motherboard
2) do some research in what part the motherboard would contain

And, then I ask you...

How much money would it take to build this new prototype motherboard, if more than one of us gave a little towards the project? $100? $150? $200? If we each gave a little, we all share in the accomplishment! I'd be willing to put up my $150 towards it...

Yes, available and already outdated and antiquated and with little to no upgrade path (not to mention little to no software support anymore). I suspect, if no one breaks us out of the rut the past Atari systems and current clones are in (and soon), we shall truely see the end of all Atari ever was, GEM ever was, and the Atari platform ever was. And even YOU won't be using an Atari clone by then...

Just how far do you think your Hades060 is going to take you? 5 years down the road? I seriously doubt it. With PowerPC, the roadmap is not only much longer, but a WHOLE lot faster...

I just wish someone else, other than myself, would see it and begin working on it! *sigh*

Someone suggested I contact Medusa directly (Ed or Odd?) since
there is no dealer anywhere near me and see if I could get the
machine directly. That is what I did and so the transaction is
in process. As far as details I suggest contacting Medusa
and getting a quote for the configuration you want.

I don't know if it's normal practice for Medusa to sell
just the parts but I ordered the motherboard+060
ATI Rage Pro+NVDI drivers, and 128meg of EDO ram.
The other parts I intend to get locally.

However, be prepared for a german reply... that is mostly
what I got but it did not stop me from pursing the purchase. :-)

I got over 8 years out of my TT and it's still going.
It's dog slow by today's standards... but alot has to do with what
you are into though. I'm getting an 060 which is mucho fast
compared to the TT and I think that will serve me for some time.
Alot of it is all relative you know.

I get the distict impression you never bother to push an Atari
beyond it's standard configuration, or considered a clone at all.
Just jumped on this grand idea.

> I tell you, if I had the money I needed to do it, I'd friggin' do it myself!

I probably have the money to back such a project but _all_ the
development would have to move to Ohio. No freaking way
I'd just give money out to strangers I cannot talk to in person.

> As a final offer, I state the following:

I have an offer for you. Bugger off an get an amiga, take on
some other crusade. They have PPC... maybe not as grand as
it could be... but it meets your CPU criteria at least.

Your problem is your view, nothing is a dead end if someone finds it
useful, even if it is outdated.

> But, I fear I am screaming in the dark. Yelling for all the wind to listen
> to. Speaking to deaf ears. Trying to show vision to blind eyes. Etc. ad

You are ranting and raving and mostly end users, or did that
not cross your mind? Most of which are powerless to really
take up a torch and fork out development money like you propose.
If you don't watch the news, perhaps you are also unaware that
alot of users are in areas of unrest and low economy.

You can try to scare everyone with your gloom and death threats,
but hmm it's been this way for many years. Atari 8-bits are still
being used and if you really think things die off completely you
better take a long hard look around.

> Just how far do you think your Hades060 is going to take you? 5 years down

My old TT went longer that 5 years, almost double that. The Hades
has PCI slots, it should go farther than the virually closed design
of the TT. All that may lack is certain software yes, but that
is far easier to obtain than some grand hardware design.

While you are ranting and raving I am actively supporting the
market that is still there. I'm not the one littering the
newsgroup day to day just spewing text that for the most part
ain't helping.

> I just wish someone else, other than myself, would see it and begin working
> on it! *sigh*

I would buy another machine if it comes available so don't
think for a moment I don't care. I think I care more since
I'm willing to purchase nearly every freaking machine released
at one time or another.

I really think you lack some sort common sense about the
situation and have been out of touch far too long.

Jared,

Let me just say you have really gotten off on the wrong foot.
The more I thought about it the more pissed off I got,
having the nerve to question me for ordering a Hades.

I spend nearly all my free time coding on freeware and giving
back to the Atari community. If I'm not doing that I'm
on IRC/ICQ helping others do the same. Granted it may not be great
stuff, but I make an effort! You think I do this because I don't
care?! So Odd codes sound drivers because he don't care?!
There are many more people here, far too numerous to mention
that release stuff free or commercial and they don't care?!
Wake up for christ sake.

Where do you get off treating people who have been dedicated
for years like they don't care?!?!?!

You are a moron. Period.

Your hardware ideas thus far have been a joke and your business
sense is nonexistant.

If you are so intent to have Hasbro involved, which is utterly
retarded, take your childish ideas directly to them... stop
posting here and insulting everyone. Nobody here is going to help you
fund anything. So far all you have contributed is eye strain, perhaps a
headache or two and upset dedicated users.

You have reached the point where you are starting to miss-treat
the very people you would intend to sell to. Pathetic.

> still just a pimple on the bottom of computing sales worldwide...

Perhaps you never realized that Atari almost NEVER advertized. The chicken/egg scenario was the norm for Atari. They did it to themselves. No advertizing = few users. Too few users... why spend money on advertizing? The Tramiels were (!!!) idiots... but hindsight is always, as usual, 20/20. Not that they would ever have changed, were they still around today. I think they would have had a LOT more users/support if they had advertized more.

> We've already been promised PPC this and 060 that, most of those promii(?)
> have not delivered...

In a market that looks like there's no reason to continue, why continue? You see, people have to realize, making an Atari clone and the genuine Atari computers are two different things. Clones are merely an effort to extend what
little vapor trail is left from the ghost of Atari proper. But a clone is not the original, and people know that. And people are leaving. And people like Lonny still go ahead and pay good money for a system that may do them well, performance-wise, but will hardly maintain long-term support, since Atari, itself, is dead. It's only a matter of time before everyone is gone and newsgroups like this one will have utterly no reason to continue. Why live in a world of ghosts trying to pretend they're still living, when... with a little cooperation, and hope, and vision, and money and dreaming, we might just be able to bring Atari back! And then this whole issue is a non-issue, because the genuine article (Atari itself) will be back!

You can call me what you like. But realize one thing... I am only trying to help all of us... past, present, and future... by trying to get people to realize that only by *giving* life to Atari can we expect to *get* life from it. It's very easy to pronounce someone dead when, by all accounts, they are. Just a few words does it. But it takes time and effort to revive them. However, wouldn't you say that, if you were successful in reviving them, you'd feel a lot better for having done so? I sure would.

> Profit? Not likely...we've proved that we're not interested in rescuing
the
> ailing platform, because we don't support the remaining vendors with
money.
> Thats why they are slowly but surely falling by the way...

Why are users not interested in saving the ailing platform? Because there is no platform to save! There is no Atari and there are no Atari computers anymore. At least no new ones. And THAT'S why no one cares.

Everyone believes that the hand they've been dealt is the one they must deal with. But that assumes that we have absolutely no ability to even try to change that. As though the very fact that it has happened makes it 101% unchangable. Perhaps it is unchangeable, but has anyone TRIED to do otherwise? I don't think so. Letters and Emails, alone, to Hasbro won't make them change their mind. They have no interest in Atari computers. What I am proposing is that we try to give them a *reason* to be interested. Is it really so difficult?

Why don't we stop arguing that I'm a blithering idiot out on a grand scale experiment of mental masterbation and start believing that what I'm saying just *may* be possible. I can't guarantee it will work, but I sure as blazes am willing to do everything in my power to try and make it work.

Obviously, I must believe in what I'm saying, or else I wouldn't keep hammering on this point over and over again. Personal dillusion? Perhaps. Maybe I'm so out of touch with business reality, I'm clueless to the actual fact that what I propose is impossible. But I will not settle for defeat until every last step has been taken and every effort has been made and Hasbro gives us a definate "No.", having seen the prototype and heard our offer. I'm not out for anything but the contentment and enthusiasm of Atari users and past Atari users, like myself. I want Atari back, so that people like you can enjoy using your Atari computer and know that the "end" of today was simply the "beginning" of tomorrows yet to be. Wouldn't you rather know that your computer had a real future, with software on the shelves and in catalogs and support by programmers and developers? To be able to wake up each morning, knowing that someone may have written another app for you to download or that another model was waiting to be bought? As I've said before, the years of being an Atarian with my 1040ST and Mega ST4, were truely, the happiest years of my life as a computer user. I have NEVER been as happy nor content since. I've been close (Power Mac ownership and BeOS user), but never exactly.

The possibilities are nigh endless... but only if we try to make the seemingly impossible... possible. But we first have to believe that such things are possible before we can gather the courage and determination to do something about it. I already have. I wish others would too.

points
> on rehashing an ancient (and it looks it!) case design!

I'm sorry you so hate the 1040ST-styled case and everything that the ST was design-wise. But the only way we can successfully advertize the rebirth of Atari (if we can accomplish what I want to set out to do), is to show people a computer they recognize. And the 1040ST was (and still is), to me, one of the best looking computers ever made. Sure, I finally got used to and fell in love with the Mega ST design. Began to even prefer it over the 1040ST design, too. The 1040sT is, I believe, far more recognizable than the Mega ST. But if you wanted to showcase a new computer by Atari, don't you think recognition would be the best place to start to get people's attention? It would definately work for me...

Jared

Ok, I apologize for my ranting and poundings. I'm just frustrated that it seems everyone is "content" to live in a world where Atari is no more and the last vapors of life are fading fast into oblivion.

You can support and program for the Atari of yesteryear, but ask yourself... where is it going to end up in a few more years? Eventually, the clones won't even be Ataris anymore (what with how mutated the OS is nowadays), if clones are even still made by then.

Do you really want that to look forward to? I sure wouldn't. And that's why I am being so adamant about this whole thing... that's all.

Jared

In German mags, I keep seeing PS/2 SIMMs mentioned everywhere. Is this German
nomenclature for bog-standard SIMMs or do they actually mean the particular IBM-
type SIMMs for PS/2 machines with size detection lines?

Try Mario Becroft's IDE interface. Install a 2.5' drive and see the difference..

The last SCSI I bought was a 4 Gb IBM and it's working fine. But
that was nearly two years ago so the exact model name would be of
no use for you.

> I need each drive to have around 4.5Gig to 8 Gig of storage Space.
>
> Cecile and HD Driver will be used as the hard drive driver software.

Since the new SCSI are very expensive I recently bought a 20 Gb IBM
3.5" IDE and an adapter and threw away the old 2.5" IDE. This also
had the advantage that I don't need Cecile anymore since the new
drive is fast enough to be used with HDDriver in turbo mode.
And with the SCSI/IDE combination I'm on the safe side regarding
to compatibility.

> I've seen advertisements for Ultra SCSI, Ultra Wide SCSI and etc. Not
> sure on which I need or can use on the Falcons.

Best stay away from 'Wide'. You would at least need an adapter and
I'm not sure if it would work even then.

Gerhard

4622. 5.25 Floppy Drives on ST/STE

Newsgroup: comp.sys.atari.st
Date: 2000-10-26 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8t8fp6$1m1$1@nd.eastky.net>
Source record: 55712

Hi Folks,

Looking to buy/trade for one or more of those old 5.25 Floppy Drives
that were made for use on the old ST's.
I'm not talking about 3 1/2 floppy disk drives, But the drives that
actually used the older 5.25 floppy disks like the Atari 8-bits use.

I know that some of these type of disk drives were made for use on the
STs. If you have one or more for sale/trade then do contact me by e-mail.

Also, does anyone have a cable or instructions on how to build one that
will allow those old PC 5.25 floppy disk drives to be used on ST's?

If so, do e-mail me.

Thanks,
phantomm@eastky.net

OK, 1994 then. A lot has happened since then.

> Clones will only go so far before they peeter out completely. How

Why? I don't think you know what a "clone" is. I bet you believe that a clone is a piece of hardware that works exactly like an ST, only faster.

far do
> you think you can hoonboggle TOS/GEM before it's so patched together nothing
> works right?

And I also believe that you don't have a clue about current TOS/GEM-compatible operating systems. Most of your statements shows your very poor knowledge about hard- and software in general, and the current Atari-scene in particular.

> I offer a chance to change all that. We start fresh, port GEM to PowerPC

Blah blah blah... Here you're talking about GEM again, an old, obsolete OS that has been abandoned many years ago by Atari *users*. Please do some research before you come around here and offend Atari-users intelligence.

> redesign the motherboard, write an ST emulator, slap it all together, and
> present it to Hasbro... along with a solidly throught out business plan.

> It's not that it can't be done. It's that no one seems to friggin' care!

How you considered that no one really cares because you're plans and fantasies are really, really far out? Because you haven't got a clue about what you're talking about?

> No one seems to want to stop living life with a "has-been system" (old
> Ataris and clones of the same) and work on building and selling
an "is-now
> system".

Why should anyone bother with a sub-standard computer (re-designed ST)
with a sub-standard OS (GEM) that's not compatible with anything else,
and on top of it all requires a complete Atari-emulator to run current
stuff? Why not buy a PC or Mac and run MagiC-PC/Mac on it? Cheaper,
faster, more flexible and available now. (Btw. since you probably
believes that I actually *want* people to switch to Windows-boxes with
a toy-emulator on top - no I don't.)

> I may be crazy for trying to do what everyone here thinks is foolish
or a
> waste of time or not worth the effort, but, by golly... I still wanna
do it!

Please go ahead. But please realize that you want to set us back ten
years, and that's why it will fail. Get yourself a Falcon or TT again,
install MiNT+N.AES or MagiC and try out some recent software before
anything else, then perhaps you'll understand why you're not taken
seriously.

> But, I fear I am screaming in the dark. Yelling for all the wind to
listen
> to. Speaking to deaf ears. Trying to show vision to blind eyes.

You should try writing for Hollywood instead of us.

> > And why do you think all of the old democoders have moved to the
PC, or
> > atleast newer Ataris?
>
> What newer Ataris? I thought that's what I was trying to do! You

They switched from the ST to the STE because it had more power. Then
they switched to the Falcon. In the end they switched to Windows.

> > The Carebears write Java-apps today.
>
> I wonder if they're as exciting as their ST demos...

As usual you're missing the point, which is that most people doesn't
find it amusing and challenging to push the hardware to the edge and
still not be able to do a fraction of the things that can be done
simply by switching to a faster computer. I don't know what kind of PC
you have, but I doubt that you're running Windows 98 on a 4Mb 486
because it's fun to push the hardware.

Bill Freeman wrote:
>
> Anybody know of a way to format a Syquest EZ135 disk so that a Mac and
> an Atari can read it?

This has nothing to do with formatting (which is always independent of
the platform) but with the fileystems created on these partitions. In
order to exchange data between the Mac and the Atari you can use DOS
compatible filesystems or the simultaneously TOS and DOS compatible
partitioning supported by HDDRIVER.
In both cases you need DOS mounters to be able to use the disk on the
Mac.

As an OS running on contemporary hardware.

clones
> won't even be Ataris anymore (what with how mutated the OS is
nowadays), if

Can you go away? Do you *need* to insult us? If you can explain...

1) ...how MiNT+N.AES or MagiC is mutated. In details please, and also
compared to your GEM-PPC, and why/how your GEM-PPC will be better and
not "mutated".

2) ...why it's better to have to push the hardware to it's limit to do
things other computers can do with ease. Is it a moral issue? Are you
Amish? Is an abundance of raw power evil? Is this why you don't want
people to be able to upgrade their hardware, because it's a Very Bad
Things and they will go to hell if they do? I just can't understand
this fear of freedom.

3) ...why a computer that's a) not compatible with real Ataris, b)
needs an *Atari* emulator (not just a CPU-emulator, but an emulated OS
and emulated hardware as well) or c) isn't made by Atari or any of it's
original designers, can be more "Atari" than current clones or
accelerators.

If you can't answer these questions without resorting to enormous
amounts of "faith", "heir", "heart", "believe", "screaming in the
dark", "care", "leap dog" and a lot of pathetic phrases
from "Independence day", don't.

X-Or contains profiles for both mentioned FM-synth models!
But X-Or is difficult to get hold off. I once had it, but sold
together with an ST. Maybe somebody could post it in this NG.

A chipset that manages devices connected to the cpu. I think it is more of a general term than for a specific chipset, as the x86 line of cpu's has its own north and south bridge. Think they're gonna redo how theirs works also, haven't read much about it though.

Youre not wrong there, but the same could be said of the other 2 main contenders. What we need is a standard, i beleive that is what is missing, there is no (Aggreed) definded way of doing things on the TOS platform.

Hi there,

Marc Wilson wrote:
>
> Hi,
>
> just wondering which is the most powerful between the Falcon and TT
> since they are both based on the same processor.

Thats where the similarity ends...

A standard Falcon clocks its 68030 CPU at 16MHz, while a standard TT clocks in at 32MHz. The TT also has faster RAM access, due to wider (full 32-bit) access to memory. The Falcon system bus only uses I think 24-bits of the full 32-bits bus to access memory. Even if the Falcon CPU was clocked at 32MHz (mine is), the TT will still run ordinary software faster due to its memory access advantages.

If you use the DSP in the Falcon however the table turns somewhat. As an example I've timed depacking of JPEG image files on an STe, Falcon, and TT. The Falcon depacker used its DSP and was about 50 times faster than the STe, and several times faster than the TT.

Other aspects draw comparison too, with the TT losing out on graphics and sound capability to the Falcon.

Both are still good machines, but the overall feel of speed would go to the TT I believe, with the Falcon winning on graphic and audio stuff...provided of course you are talking 'standard' machines, as both can be upgraded significantly!

> see it and walk out. We have to convince them that it *will* profit THEM.

Profit? Not likely...we've proved that we're not interested in rescuing the ailing platform, because we don't support the remaining vendors with money. Thats why they are slowly but surely falling by the way...

> But I believe that starting out with the original 1040STand Mega ST cases

> Atari in people's minds and regain mindshare with the public. Ya have to
> admit, no computer made past or present looks like an ST... and that, I
> believe, is the key to successfully restarting Atari... the computer
> company... once again.

No computer looks like an ST for good reason...copyright, oh and also that non-separate keyboard issue, and the lack of easy expandability issue. I'm sure Apple and others are just waiting patiently for the opportunity to make a G4 in the style of a 520STf...NOT! Even I hate my Falcons design to the point I'm building a CPU box and separate keyboard...why the Mega and TT style cases were not used initially was a giant joke to me. The software and (operational aspects of) the hardware I love, but forget winning points on rehashing an ancient (and it looks it!) case design!

Linux is certainly there, but there remains a majority hardcore group
of people called 'dummies!' who couldn't even type 'ls -l' to save
themselves. They will forever remain (along with their local Windows
help person!) bound to the Windows platform. Linux requires more than
just 'single cell' intelligence to use unfortunately, and there are
to many issues with 'flavours' ie Xfree86, debian, redhat etc...for
most people to be bothered with...

> we're all so friggin' stuck in.

We're not stuck with it as a mentality. Its just that bigger society decrees
we keep up, because thats where the money is...without keeping up we
stay as
a gonowhere platform...

> Why do you think that the Atari ST's were so expoited with demos and
> programs that took it beyond what it was designed to do? Because they HAD
> to! They couldn't just pull out the RAM and video card and stick more in.
> They had to make use of what was there and they did...

Demos are a great concept, bad execution scenario. When people bite thru the
candy exterior and find nowt but air, what do they do? I've had hardcore
PC plonkers go 'wow!' over some of the demos on my Falcon, but then I cannot
view 75% of the websites in the world because I can't do JavaScript etc...
so my friends ask, what else can it do? Apart from APEX media, music,
and a
few other 'GEM's' there isn't much that they already aren't doing...

Demo-coders live in a 2-faced world. They create these wonderfully
entertaining pieces of software whilst completing computing degrees
so they can go work for the very platforms we snivel at ie..PC/Mac etc...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

I think the Desktopper should have room for a 5 1/4" drive, but I'm not too fond of it. It looks and feels flimsy and ugly. I don't think the MkX case can fit a 5 1/4" drive.

But, since you want to use an 3.5" IDE HD _AND_ an internal CD-ROM, the only one that fits the bill (I believe) is the Wizztronics Falcon Rack. It has room for 1 3.5" FD, 1 5 1/4" Drive (CD-ROM in your case), and either 1 3.5" HD and 1 2.5" HD or 2 3.5" HDs with some fiddling.

The Falcon Rack is BIG (that's why it can fit so many drives), so make sure you have room for it. (19"x17"x5.25")

Also, Wizztronics has a Falcon Rack clearance going on right now, so check it out. (www.wizztronics.com)

IIRC there is a hack on Vezz's hardware hack site. Includes
instructions for making an adaptor. It's under the drives section.

Sorry the URL escapes me as it seems to change so often, but if you do
some searching for "Vezz's home page" and maybe add "music" in the
search as well you should be able to get back to the Atari index.

I think, but not sure here, that System Solutions sells them them as
well as Titan Designs (Coretex). The Milan motherboard can be bought
on it's own with just a few driver disks for the installation as I
believe Joe Conner did this. Joe Conner aparantly sold his, not sure
why.

Anyway I'm thinking about getting just the Milan mother board as I'm
getting fed up with this STe. I might see how much the motherboard
costs for the Hades as well.

Seeign as I sold this one I guess I ought to help....

I'll admit the Ice Mouse is a lot less than perfect, but it was only
ever sold as being a cheap mouse that worked with the interface....Some
PS2 mice don't seem to work though an adapter...sorry....I don't know
if Mario is keeping a list but I epect he'll pick this up now....I've
always advise people to get 9-pin mice, and specifically recommend the
Genius Netmouse Pro. AFAIK the Mouseburster has an absolutely stock
RS232 interface, it has an industry standard RS232 transceiver, though
I can believe that the PS2 interface uses a faster variant....

Sorry that this can't solve the problem, but the best advice I can offer is to stick to serial mice, unless you get a chance to try it first...

Even with 5 people that knew what they were doing, and were near experts on atari software and hardware... it would take 6 months of full-time ass-hauling work, much longer if only in spare time. Prototyping might be difficult, but affordable if they split costs.

>2) do some research in what part the motherboard would contain

This, even you might be able to do with someone to help you get started. I don't think you will find that person here, they're all too busy wallowing in what atari hardware is, rather than wondering what it could be.

>And, then I ask you...
>
>How much money would it take to build this new prototype motherboard, if

>If we each gave a little, we all share in the accomplishment! I'd be
>willing to put up my $150 towards it...

Prototype? You can't even buy the parts necessary for it, minimum quantities and so forth. It would take months of begging and pleading with sales reps, to get them to send samples. Besides, the prototype doesn't mean much, if a production unit is going to be impossible. Maybe with 50 or so people interested, a kit could be sold at quasi-affordable prices, but the masses have spoken. They're worried about hardware support (even though they have none now), porting their various OSs to the pc, because we all know that the only thing wrong with a pc is that windows sucks, etc. I'd give up, if I were you. And I'm not one to give up either. Look at it this way, do they deserve anything more than they have?

Hi Chris!

>Seeign as I sold this one I guess I ought to help....
>
>I'll admit the Ice Mouse is a lot less than perfect, but it was only
>ever sold as being a cheap mouse that worked with the interface

Yes I know. It's a good mouse for the money and I only bought it so I knew it would work out of the box, as to say.

>....Some PS2 mice don't seem to work though an adapter...sorry....

Don't worry it's my fault, I should of asked you first! The guy in the shop said that these adaptors you can get don't work on all PCs either, but I'm just a bit annoyed as he won't take it back, even tough it's only a day old, and packaging is intact.

>I don't know if Mario is keeping a list but I epect he'll pick this
>up now....I've always advise people to get 9-pin mice, and
>specifically recommend the Genius Netmouse Pro.

Is the Genius Netmouse solid, strong? I've had trouble getting hold of them. I really need something that is good and solid, and very accurate.

>AFAIK the Mouseburster has an absolutely stock RS232 interface, it
>has an industry standard RS232 transceiver, though I can believe that
>the PS2 interface uses a faster variant....

Well seeing as the serial adaptors don't work on some PCs as well, then I blame the people who supply adaptors with there mice, which doesn't state that it may not work. The mouseburster is excellent piece of kit, and if anyone is wondering about purchasing it, don't let this put you off! Just don't try using adaptors with any computer!

>Sorry that this can't solve the problem, but the best advice I can
>offer is to stick to serial mice, unless you get a chance to try it
>first...

I was going to buy a serial version, but had to get the one with the adaptor. It seems serial mice are getting rarer, as out of the 20 odd

mice they sold ~15 were PS2 and ~5 are USB.

PS/2 mice are also serial mice, but they use a different protocol. It's not "converted" really, mice that comes with PS/2->serial adapters supports both modes and detects the adapter automatically. Since his mouse was shipped with an adapter, I believe it should work fine. It could be that it draws more power than the interface can deliver though.

This "Mouseburster", is this the same interface as Mario B. sells? I have one of those, and I use an A4Tech trackball with PS/2->serial adapter, and it works perfectly. I can even use the scroll-wheels for something sensible, forward == double click, backwards == click and hold :-)

> to do with transfer speed, as I believe the
> PS/2 port is much faster.

If it works on a PC using the serial port, this can't be the problem.

Um - no. There are a lot of machines that require parity, and your el-cheapo
simms which do not even conform to the standard in terms of presence
detection pins won't have parity, either.

Furthermore, there are such variants as 33-bit, 36-bit (without single-byte
write capability), 40-bit etc., which are used in workstations.

Some IBM machines require such special types instead of "normal" PC-style
72-pin SIMMs with 32/36 bits.

>particular 72-pin SIMMs with speed and size detection lines which are not in
>place in the SIMM you commonly buy at the computer shop.

Then these SIMMs are broken by the standard.

>I'd rather consider the Atari cards broken, since they then refuse to accept all
>SIMMs I have, spare for my 2 precious IBM ones.

I have lots of SIMMs that work fine in my Atari ram cards.

The MagnumTT card has jumpers as a workaround for broken SIMMs, but the
problem is clearly on the SIMM.

I still have a Falcon upstairs in the original box with a possibly
broken diskdrive, original HD that fails to spin properly sometimes.
So, that's where I'm coming from.

Today I'm running iCab, a great browser with Javascript / JAVA and all
the Netscape plug-ins. Live video streaming et all on just a G3 233MHz.
The lowest Motorola G3 speed available.

My turn to the Mac side has been easy, ResEdit was almost the same as
the TOS resource insides. I could really see where the ST was coming
from. Everything looks very familiar, I was porting my Falcon icons
before surfing the net. There is also a very helpful community
(uk.comp.sys.mac) and all software for the Mac, including high quality
shareware, can be found at www.versiontracker.com

Like the ST all iMacs are user friendly and with millions of users for
each revision www.macfixit.com supplies all the solutions needed
because unlike PC's they all use the same parts during each revision
(revA (slow video) revB great & cheap, c,d & e)

Even the revA can emulate Playstation games, and will be capable of
running the Mac OS 10, now in beta)

And you can run your current software:
NoSTalgia is a full Atari ST emulator, rather than just emulating an OS
as MagiCMac does. Although it's still in beta, many games and
applications run perfectly! The hardware support includes full video
and sound capabilities, and the most recent version is even faster than
before!

And there is more:
PowerST is a new Atari ST emulator by the author of NoSTalgia! Although
the feature set is very similar, PowerST includes an assembly core
making it three times faster than NoSTalgia, and is shareware.

With the introduction of the cheap iMac Mac OS has become a logical
upgrade path for TOS fans. Many article's featured steps for this, a
nullmodem cable seems the most logical to me. Try a second hand iMac,

you'll like it.

However we too are saying goodbye to our GEM like Mac OS, and will be joining the UNIX camp. OpenBSD to be more precise. However Apple has got several millions to burn and if you don't wasn't too see a DOS like screen you can dump the terminal program as everything is mouse based. Not like Windows but as in the Mac logic, even the boot ROM selection menu (a secret place before any OS has even loaded is graphical).

OpenBSD has more software than Linux and I'm sure people are going to make a lot of it user friendly by putting a GUI on them with the stringent Aqua GUI guidelines.

However Apple (unlike MS) does have engineers who believe in clarity; The OS has been dived in abstraction layers with the Mach microkernel, BSD networkservices, OpenGL3D/Quartz2D/Quicktime multimedia engines and on top of that libs for application calls from Carbon (modernized Mac), Cocoa (Objective C) and JAVA programs, all using the Aqua User Interface.

Instead of resources (used in TOS and Mac) we will use XML structured folder layouts with all icons, text and preferences in generic formats. Allowing for easy translation and access by powerusers as XML is a new type of HTML. Such a filled folder will be marked as bundle is considered as a single file/program.

However you can let any pictureviewer look into this folder and change all the icons as they are all individual files. It is just a folder filled with pictures! And alert texts, and menu texts. No, it's not a mess, it is all structured according to the XML index file!

And to show the world there are no cracker holes in the core of this OS the whole Kernel and network core is open source! It's called Darwin.

http://www.apple.com/macosx/technologies/inside.html

Mac OS 10 is comes out around March 2001, so when you're thinking of cheaply upgrading think about a second hand iMac, any iMac is future proof. There is an iMac sold every six seconds, so there is bound to be a movie editing newby who does his old one away for cheap!

Apple is very informative check out:
www.apple.com

DAVID L. ORMAND <dlormand@aztec.asu.edu> wrote:

> What isn't clear to me is, how much is MiNT a REPLACEMENT for TOS, versus
> a SUPPLEMENT to TOS. Obviously, it doesn't run anywhere else but an

It's a GEMDOS replacement, it requires a few (X)BIOS-functions to
work. However, you can replace virtually all (X)BIOS-dependency by using
proper device-drivers.

> Atari machine (or emulator on another platform). Could MiNT run without
> real Atari TOS somewhere in the background? If so, it should be possible

Yes, if you implement the missing (X)BIOS-functions or embed this
functionality in the kernel. E.g. MacMiNT use a minimal
TOS-implementation.

> to port MiNT to peecees and Macs (in the very same way Linux has been

Indeed. However, there's a lot of 68k-assembly in the sources, so it will
require a lot of work.

> And this would be a fine start. Wouldn't run on anything but a 68K Mac, but
> then PPC would follow (is there an open-source 68K emulator for PowerMacs?),
> and eventually an Intel port. Probably the Intel port coming first would

You can start by writing a small microkernel that boots on a PC or Mac,
and which includes a 68k-emulator, a few (X)BIOS-functions, a
XHDI-compatible hd-driver and a MFP-emulator (not strictly necessary, but
it does wonders for compatibility). This would then boot MiNT, and you
have a PC/Mac with MiNT as the native (no, not native code) OS.

Computers can last for lifetimes..... they all do the purpose they were
intended to do..... atari consoles still play games, atari STe's and
Falcon's are still used in home recording studios, TT's are still used
as UNIX workstations and so on..... if they get 'out dated' then you
'up date' them by configuring some way of wiring the newer components
in.

I don't expect the windoze addicts to be interested in Atari. These
people sneer at our STs and Falcons now, it wouldn't change if the
system ran on their own peecees. No, I'm talking about those very
Linux freaks, and others interested in hacking on their computers to
the point where they WOULD consider/prefer CLIs. Adding even just
a few of those would be more Atari developers than we currently have!
And not having java, realaudio, etc. seems to serve as motivation to
these sorts!

>system, more specificially) and write an Atari ST emulator for the system?

With sufficient technical assistance, I've no doubt that you could turn out an excellent PowerPC-based motherboard in a couple of years. Building computer hardware is not so much the problem. Recouping your Non-Recurring-Engineering costs will be tough, though, unless enough people buy them at slightly (or greatly, depending on the size of the market) inflated prices.

The BIG problem is this software issue. We can't rewrite GEM, or TOS, for any processor, because we don't have the rights or the source. Hasbro has them, and holds onto them despite several attempts by people in the Atari community who are interested in furthering the Atari no less than you. The only real hope appears to be a from-scratch license-free approach - namely MiNT.

I believe in your vision - and I'd love to see the Atari world include other machines (more powerful, if not more interesting) than the current STs and Falcons and Hades and Milans. At this point, I don't think we (you) should be so concerned with hardware, whether it runs on a new PowerPC architecture (like you want to design) or existing Mac and peecee systems. We need system software capable of being ported to these other systems. Original TOS/GEM seems (per Hasbro) to be out of the question. Some would argue that Magic is the best alternative, but ASH is not likely to release the source code nor do they have the manpower or interest in this sort of flight of fancy. That leaves MiNT.

I am interested in learning more about MiNT, maybe hacking a bit on it, if my personal load ever alleviates. I suggest you do the same.

>Clones will only go so far before they peeter out completely. How far do
>you think you can hoonboggle TOS/GEM before it's so patched together nothing
>works right?

The Milan TOS is not "patched together". Those parts that needed
modifications were modified or completely rewritten to suit the new
hardware. I don't see where this would be different for a PPC machine.

>redesign the motherboard, write an ST emulator, slap it all together, and
>present it to Hasbro... along with a solidly throught out business plan.

Sorry. Do you know how much even the prototype boards would cost? *I* would
not finance (another) such project without talking to Hasbro *first*.

>I've currently been doing some research today on parts and PCB fabrication.
>Assuming a motherboard four layers deep (don't know if that's necessary or
>not), I saw one site saying it would run about $500 to do a prototype. I
>sure hope that includes parts soldered on it...

The price sounds reasonable, but without parts. PCB fabrication has high NRE
costs, especially for multilayer boards.

>The prototype is always going to be the big expense. After that it gets
>cheaper.

Yes, but only reasonably if you are talking about production runs in the
100-1000s at least.

>I may be crazy for trying to do what everyone here thinks is foolish or a
>waste of time or not worth the effort, but, by golly... I still wanna do it!

Go ahead. But since you showed in the past that you have (IMHO) strange
design goals, that would not be a machine I would want to work with.

>Oh, you mean THOSE "newer Ataris"... uh, sorry, not by my definition... If
>it ain't got the fuji and it ain't got the name and look... it ISN'T an
>Atari. It's a hackjob clone. And "Homey don't do that..." ["In Living
>Color" reference]

I predict it's closer than you will get. They are working machines,
completely designed from scratch, with modern peripherals and without legacy
atari stuff, and at a very affordable price (given the constraints of
production batch sizes).

Having the name "Atari" on them won't produce any more exiting software to
run on your machine.

>diagram with instructions?

No. I reworked it for an easily mass-produceable version, which was never
built and tested, and do not have the original sources (for the one PCB i
made and which now sits in my TT).

However, unless someone goes ahead and writes a MiNT driver for the card,
there is no use in publishing the thing: if you really want to build one,
you can use the original docs by Ulrich Roehrl (sp?).

Not exactly. You need a PPPoE protocol layer between the ethernet card
driver and the PPP protocol stack.

If you write that part, then you can use the DSL service as described - the
hardware only requires a normal ethernet card, the software is the problem
(at least I am not aware of a PPPoE solution for ataris).

You've been doing your homework. Very true. With the adapters the
Microsoft mouse boots up in mousesystems mode, and the Logitech boots
up in microsoft mode (funnily enough!) according to my software. But
then, the mouseburster accepts both modes so it should work,
theorectically.

>Since his mouse was shipped with an adapter, I believe it should work fine. It
>could be that it draws more power than the interface can deliver though.

The strange thing is, the cursor doesn't even move at all, neither to
the buttons work. It seems like it is power. Aparrantly the unit
takes the voltage off the rts/cts lines IIRC. I might look up an
adaptor, to see how they are wired, and I'm going to check what sort
of voltage is getting to the chip inside the mouse.

>This "Mouseburster", is this the same interface as Mario B. sells?

Yes indeed.

Hey, I'm not the one tossing swear words around, you are.

Anyway I am totally against emulation on x86 chips, I am in your
camp! If we must migrate I want PPC.

> >Your hardware ideas thus far have been a joke and your business
> >sense is nonexistant.

> Business sense aside, it seems his ideas aren't any worse than anyone elses

> calling it the end.

That's a hard one since the machine is almost totally a hobby
platform. Trying to make some machine full of custom chips
for near 100% compatibility just cannot be done in this day
and age, way to expensive. On the other hand if you sit down
and layout a nice design to get the machine close to today's
"standard" machines, then you end up with a somewhat generic
design like a MAC. Probably not what everyone would want
and can it be done for a reasonable price? Problem is
you can get an iMAC for 800 bucks and magicmac, so what
ever one designs better be fairly low cost.

About the only solution I can think of is to use some
existing PPC board design, or figure out how to get
the OS to completely take over a MAC, such that you
could toss out macos.

As far as Jared is concerned, it's great one is pro Atari
but geesh, he needs to calm down. A few things that would help:

1) Stop complaining about how Atari treated him/us... it's
a done deal, why keep bring that up? Serves no purpose
towards the goal.

2) Know that this is a public forem for users, if I recall
this is not comp.sys.atari.hardware.design, most of us
here are not going to send money to someone on a whim.

3) Quit accussing everyone of not caring. That is just
not right or true at all.

4) Just stop repeating the same crap over and over...
it's getting old. Obviously there are flaws in the plan
or we would not be having this sort of discussion.

5) Get an Atari and use it, at least get to know what
you are talking about.

If he wants a real business plan I suggest:

1) Take the idea and outline it in great detail on
a webpage, set up some sort of sign up form, survey or
msg section or whatever... make it professional looking,
note the items I listed above... maybe then he might see interest.

2) When #2 is setup post here a simple message where to
go look, signup for support, and so on.

I think this would work better than posting stuff here
and rehashing most of the same stuff over and over.
I don't particularly like being harassed because I ordered
a hades, at least I am actively support the market.
That is what upset me, cause all I'm hearing is talk from
someone who is obviously out of touch.

> because it's fun to push the hardware.

I'm not advocating pushing the hardware when the hardware isn't capable and doesn't have room to spare. I'm advocating creating hardware that has LOTS of capability, but forcing the software developers to USE it, not just code any old way they want, just to fill up 64-128Mb of RAM with a bloated OS and hundreds of megabytes of hard drive space, just because they're too lazy to write some decent code.

If the only computer was a 4Mb 486 (and at the time, it may have been), I'm sure Win 3.1 ran quite nicely on it. And apps as well. But as technology gets faster and hard drives and RAM get larger, programmers realize how much room they have and stop caring how well they program, figuring "Oh well... they'll buy a faster CPU or a larger HD or more RAM to use this game." or whatever.

Graphically, there is NO game written to day that takes full advantage of, probably, even a nVidia RivaTNT grpahics chip! Why? Because the TNT2 came out. And then the TNT2 Ultra and GeForce 256 and GeForce GTS, etc. So fast has technology advanced that no programmer has *reason* to optimize for one graphics chip, because it's far easier (and cheaper) to let the user buy a faster video card and CPU, than to optimimize the game to run well on lesser hardware. Which, by the way, because of the PC mentality of today, no one seems to keep, because why not buy faster and better, even if you don't need it, just because it's there!

How fast is a Sega Dreamcast? What graphics chipset does it use and how much VRAM does it have? How much main RAM does it use? If you look at games like Soul Calibur and Ecco the Dolphin (Defender of the Future), you will see how optimized games and software can be on hardware that is vastly less powerful than a GeForce GTS and far slower than a PIII650 or so.

Why? Because they HAVE to! But do game players complain? No. They enjoy their games and systems, because they look forward to better and better games that really push and use the hardware to it's limit, depending upon how much effort the companies put into each game they write.

Wish I could talk longer, but I've got to get my son off to Grandma's.

Jared

we dont strive to prove our latest clones, PCs are advertised on the TV,
Radio, Magazines, and websites.
The Atari clones are just given fame by word of mouth mostly and maybe
the odd mention on LGD.

>
> We're living in the ashes, instead of soaring above the clouds. All because
> no one is willing to admit that the way things are is no longer worth a hill
> of beans to anyone!

The whole point, i think anyway, is that people try and prove themselves
by getting what was in their Atari's and modifying it like overclocking
the CPU, stuffing the ST with more RAM than you would put stuffing in a
turkey and so on.... then we can look at our modified atari. if we/they
wanted to be soaring above the clouds we'd be using the latest multiple
G4 cpu system or big and bad DEC/Compaq Alpha stations which would scare
the Pentium III and Athlon back to the drawing board. Atari is dead,
people modify their ataris so they can do things they couldnt in the
past. If you make a new computer from new hardware and new software than
how can you even mention Atari? This is like making a new car because

you loved the Ford Sierra, the chasis is different, the engine is
different, the only similar thing is that the dashboard or stearing
wheel look vaguely similar but it still isnt a Ford Sierra.

>

> trying to make due with what's left, ever since!

Atari is still around although they only make software now and it's
basically just the name owned by Hasbro.
If Atari was still around and making newer ST/TT/Falcon computers, would
you still want to build this Phoenix thing?

>
> I left the Atari scene years ago and, except for that pesky memory of
if you left the atari scene then why are you still on about making the
Atari ST compatable system?

If you want to make a super-computer, why not make somethiing that looks
better than GEM, if an average atari user saw something like GEM on some
big cased computers screen he'll probably think: nice job someone did
shoving their ST into that case!!!!!!!

>

> there.

what's the whole point of your 'dream' then? to build a new computer
which isn't an atari clone or an atari but can run atari stuff with
little emulation? I think you missed something there!

>
> Software development is fueled by hardware potential. The reason so few are
and dedication, hobbiests, as well as competition

The GEM's look and feel doesnt matter, use this 'inspiration' you have
and build your own look and feel
and again, i thought you said it wasnt an
ST-clone???????????????????????????

>
> If we're not trying to keep the spirit alive, then it's truely pointless to

The spirit of Atari is to expand your Atari's full potential, I think
so, by getting it to do new things.
if your computer is keeping with the spirit then why does the interface
have to look like GEM? People have
got ISA cards and made some kind of method of using it on a VME bus, if
you just give them a system that's got everything, then it wont
progress. you need people with inspiration not a bunch of dummies that
just switch it on and use it.
>

> we're doing it, it doesn't matter if the app runs on a PC that runs GEM or a
> GEM system that runs off a PowerPC.
GEM is a very ancient program, why dont u just get hold of X11 and port
it?

>
> It's the apps and operating system that makes us happy. And if changing
> direction, to allow us new opportunities to innovate and create, is what we

The OS? So, your gonna harness all the PowerPC's power onto TOS?

>
> Money, right?
yeah.... how you gonna get all the money needed to get a license to use
certain stuff, the amount of hardware you'll need.....
btw..... because there will be hardly any made ccompared to PCs or Macs

(massive amounts of money and massive companies), how are you going to
cover the development costs? if your system costs more than a more
powerful PC or Mac then what are you going to attract people with? I's
rather buy a powerful PC for less than a non-atari clone that runs atari
stuff (sounds like a botch-job to me!) costs.

> Time, right?
How many people can give up their spare time, we're either all working
and then resting or were studying. Anyway, if you made a website
detailing what exactly it is that your going to do, send the address to
us on comp.sys.atari.st instead of preaching as if your a god or
whatever.

> Effort, right?
What will attract people to write programs for some sort of evil hybrid
of a badly designed power mac and an ancient atari instead of writing
programs for Linux which runs on ARM, Alpha, MIPS, Intel, and PowerPC as
well as atari's already or we will build hardware that's compatable with
your motherboard with bits getting soldered into it instead of building
our own sound cards, water cooled systems, and so on for PCs, Macs and
other things?

>

in article sDDJ5.39$ST2.9442@news.goodnet.com, Jared Falvo at luposian@mailcity.com wrote on 10/25/00 8:12 AM:

> Upgrading one's computer when you don't NEED to upgrade is pointless and a
> waste of money. If your video card hardware and RAM have yet to be fully
> used to their potential, then you waste power just for the sake of having
> more power. Where's the logic in that?

Everyone "needs" to upgrade at one point or another as technology advances. I remember at one point thinking how cool 320x200 512-color graphics (with Spectrum 512) was on my 1040ST at 8MHz. Now my Falcon has become slow and either low-res or low-color compared to "modern" computers. No matter how great your computer idea's video/memory/CPU/etc. are, sooner or later they will become seriously outdated and slow for the modern applications at the time. It's just plain blind and ignorant to say that you won't need to upgrade.

> I dare say a new Atari system, based on 32Mb of RAM and a good video chipset
> with 4-16Mb of RAM could easily last a year or more, if people would exploit
> it's capabilities and get out of the "keeping up with thre jones" mentality
> we're all so friggin' stuck in.

By today's standards maybe it'll last that long. But by the time you get this machine in production (if ever), the specs you're suggesting now won't be good enough anymore. Let me rephrase your "keeping up with the jones'" statement. It's actually more like "keeping up with technology". If a computer can't run modern applications, with a modern interface, at modern speeds, it will seriously limit the users ability to do what the rest of the world will consider "normal" work. With each leap in technology, users DO push the limits of their hardware/software (especially Atari users trying to "keep up"). And as this creates new demands that software and hardware must meet, a non-upgradable design will quickly fall behind, no matter how good it is at the time of its release. You're basically talking about making your computer disposable. Use it for as long as you can, then be forced to throw it out and get a new one or become adept at doing complex DIY upgrades (which most average people won't do). This would mean your computer would have to be incredibly cheap (cheaper than most cheap PC's for me to even take an interest). Besides I want to have a computer that will last more than a year or two. That's part of the PC mentality that most people here hate, I think.

> Why do you think that the Atari ST's were so expoited with demos and
> programs that took it beyond what it was designed to do? Because they HAD
> to! They couldn't just pull out the RAM and video card and stick more in.
> They had to make use of what was there and they did...

Every outdated computer has a following of people who make demo software that pushes the limits of the machine's hardware. People are doing the same with Atari 8-bits, but I wouldnt want to rely on one of those as my primary computer. Besides, just because they do it doesn't mean it's easy. And since it'd become increasingly more difficult to get outdated hardware to keep up with modern applications, no matter how skilled a programmer they have, software companies would have to charge extreme amounts to keep software supplied to your computer because of this fact. If you want a computer that is to be supported and commercially viable, it must be easy to keep up-to-date, and easy to program for, otherwise software companies would drop you in a heartbeat.

> How I loved the CareBear demos and Enchanted Lands and some of the other
> apps that really pushed the envelope with the ST. And I strive to bring
> those days back, if at all possible.

Just think what kind of demos one could do on updated (and updatable) technology! If you really want to bring those days back get an ST and run all the demos you like. It still won't change the fact that the ST is outdated and unexpandable (without difficult DIY contraptions) and won't run modern apps.

> "Waste not, want not", as the saying goes...

How about "an ounce of prevention is worth a pound of cure"? In other words, if you make an expandible computer design to begin with, not only will it be more attractive to the average public, it will be less of a headache to upgrade when it becomes obsolete.

> present it to Hasbro... along with a solidly throught out business plan.

I still have a Falcon upstairs in the original box with a possibly
broken diskdrive, original HD that fails to spin properly sometimes.
So, that's where I'm coming from.

Today I'm running iCab, a great browser with Javascript / JAVA and all
the Netscape plug-ins. Live video streaming et all on just a G3 233MHz.
The lowest Motorola G3 speed available.

My turn to the Mac side has been easy, ResEdit was almost the same as
the resource files inside TOS. I could really see where the ST was
coming from. Everything looks very familiar, in fact I was porting my
Falcon icons before surfing the net. There is also a very helpful
community (like uk.comp.sys.mac) and all software for the Mac, including
high quality shareware, can be found at
www.versiontracker.com

Like the ST all iMacs are user friendly and with millions of active
users for each revision www.macfixit.com supplies all the solutions
needed because, unlike PC's, they all use the same parts during each
revision period. The first is called iMac revA (and has slow video),
revB is great & cheap, revC, revD & revE all advance little steps up to
DVD playback and easy to use video editing with DV camcorders. (Ugh, who
wants that :-)

Even the revA can emulate Playstation games, and will be capable of
running Mac OS version 10 (now in beta)

And you can run your current software:
NoSTalgia is a full Atari ST emulator, rather than just emulating an OS
as MagiCMac does. Although it's still in beta, many games and
applications run perfectly! The hardware support includes full video
and sound capabilities, and the most recent version is even faster than
before!

And there is more:
PowerST is a new Atari ST emulator by the author of NoSTalgia! Although

the feature set is very similar, PowerST includes an assembly core
making it three times faster than NoSTalgia, and is shareware.

With the introduction of the cheap iMac Mac OS has become a logical
upgrade path for TOS fans. Many article's featured steps for this.
A nullmodem cable seems to me the most logical way to connect the two
machines. Try a second hand iMac, you'll like it.

However we too are saying goodbye to our GEM like Mac OS, and will be
joining the UNIX camp. OpenBSD to be more precise. However Apple has
got several millions to burn on userfriendly development and if you
never want to see a DOS like screen you can dump the terminal program
without hesitation as everything is mouse based. Not as half baked like
Windows but like the Mac has always been, even the boot ROM selection
menu (a secret place before any OS has even loaded) is graphical.

OpenBSD has more software than Linux and I'm sure people are going to
port a lot of software to become user friendly by putting a GUI on them
with the stringent Aqua GUI guidelines.

However Apple (unlike MS) does have engineers who believe in clarity
underneath the eye candy. The OS has been dived in abstraction layers
with
- the Mach microkernel,
- BSD networkservices,
- OpenGL3D/Quartz2D/Quicktime multimedia engines and on top of that
- libs for application calls from
- Carbon (modernized Mac),
- Cocoa (Objective C) and
- JAVA programs,
- all using the Aqua User Interface.

Instead of resources (used in TOS and Mac) we will use XML structured
folder layouts with all icons, text and preferences in generic formats.
Allowing for easy translation and access by powerusers as XML is a new
type of HTML. Such a filled folder will be marked as what we call a
Bundle.

A Bundle is a folder which is considered as a single file / program.
Much like a ZIP archive file without the archive or compression part.

However you can let any program, like a pictureviewer look into this
folder and change all the icons, as they are all individual files. It is
just a folder filled with pictures! And alert texts, and menu texts. No,
it's not a mess, it is all structured according to the XML index file!

And to show the world there are crackable holes in the core of this OS
the whole Kernel and network core is open source! It's called Darwin.

http://www.apple.com/macosx/technologies/inside.html

Mac OS 10 comes out around March 2001, so when you're thinking of
cheaply upgrading think about a second hand iMac, any iMac is future

proof. There is an iMac sold every six seconds, so there is bound to be a movie editing newby who does his old iMac away for cheap!

Apple is very informative check out:

You know, Jared, I completely feel for you. I would love (as I'm sure many would) to go back in time and buy Atari before the Tramiels did. I'm sure any of us would run it better than they did (although the ST was initially their idea). You should realize that all of us here are/were just as bothered and frustrated by what Atari did (i.e. not advertize, then pack up and leave when they were on the losing end because of it) as you seem to be. But we also realize that resurrecting the name and recreating a modern ST look-alike really isn't that promising a way to go, and most of us would rather spend our money and energy on something more productive. Here are a few points to consider:

1. You mentioned that clones were "propping up a dead horse and giving it a new coat of paint". How is what you are proposing any different? Reviving a dead name that no one but us die-hard and a few 80's nostalgics even remember? And giving the computer the old ST look isn't even a new coat of paint! It's the same old decaying skin.

2. A brand new company without the loaded (and sometimes negative) reputation would stand a better chance. Creating a market in the U.S. for the existing clones would be easier and more well-received, as most of the computer-buying public remembers Atari as a video game company if they remember it at all. And creating any kind of new computer market is no easy task. First, before anything else, you need a guarantee of massive, modern software support by recognizable companies before anyone other than Atari-enthusiasts would buy one. Second you need a reason (besides nostalgia) for the public to want to buy one of these instead of a PC or Mac. So you need to offer something that these machines can't even come close to doing. And since most of the buying public has a lust for recognizable brand names (with a great reputation to go with it), good luck with that. Finally, you need good, inexpensive, massively available hardware

ready for stores now. This takes much more cash than you're talking about getting.

3. Anything you come up with, no matter how much it is like the original, will still be a clone. Reason: It won't be the same Atari (people, place, hardware design, etc), you are proposing a completely new internal design with new features, being different hardware, it either will not run the old software or would require massive emulation to do it, etc...

4. How is any of this different than what Milan and Medusa have been trying to do (Milan even tried to get the rights to the Atari name once)? It'll be different hardware, different software, you'll have to update the OS with a more modern design, networking capabilities, and other features expected of a modern OS (which has partially been done already in the form of Magic and Mint/NAES), etc. The only difference I see is your focused attempt to get the name and the look back, which is first of all just a facade that doesn't really have as much weight as you seem to think it does, and second would end up costing us more in the long run than it would to just simply support the companies that are out there already doing what you want. I would rather send $1,000 to Milan to fund making a PPC-based Milan III than to your idea simply because it appears your sights are set too narrowly on a name and a look than on the realities of business. Besides, Milan already has motherboard prototypes that would just take small changes to make them exactly what I would want in a new "Atari" machine. What do you have?

5. Finally, don't bring up the Hasbro connection as your reason for this being different. They won't go for it, I promise. Look at what happened with Milan's attempt at the Atari name. Even an existing company that Hasbro wouldn't have to send any money to at all couldn't get the rights to use the name. And you expect them not only to give you rights to the name, but give you a part of an initial investment? Even if Milan offered money for their name rights, they wouldn't get it. What makes you any different? Why would Hasbro listen to a single person with radical ideas who they've never heard of, when they won't listen to an already founded company with supposed links to Motorola, Hewlett-Packard, and other well-known companies?

Now, I'm not trying to be negative or discouraging. I'm just trying to shave off the rough edges of your ideas. If you stay too focused on one unbendable concept without taking advice and criticism from others, your computer idea won't only not fly, it'll fail absolutely misreably. Instead of wasting our time here trying to make a company that in all likelyhood won't happen, support the companies that already exist. Everyone will be the better for it.

Magic on Hades was a real port. For Magic on Milan, Andreas Kromke removed
the Magic Bios/XBios/VDI and made Magic use the TOS's routines in the ROM
(which were modified to suit his needs).

I've used both a Logitech Trackman Marble+, which comes with a PS/2 to serial adapter - and a Microsoft Wheelmouse, also with a PS/2 to serial adapter. Both work perfectly with Mario Becroft's interface connected to the Falcon. A thing to keep in mind is that none of those mice work with a standard PS/2 to serial adapter - and not if I switch and use the Logitech adapter for the Microsoft mouse or vice versa, so it's important to use the correct one - otherwise it won't even work correctly on a PC!

I think that you are kidding yourself. I would think that most gamers don't give a tinker's curse whether their hardware is being pushed to the limits or not as long as the game is fast and affordable. There will always be a tradeoff between hardware and software costs but the dividing line is invisible to most users.

Going back to a previous posting, I think the Turing test is one of the best analogies I have seen. If you cannot tell from using a computer whether it is a "true" Atari or an emulated one, then it doesn't matter.

Hi

Sorry couldn't resist this anymore. First off Jared, try Mint and/or
Magic as Jo Even suggested. Everybody (well atleast 99%) who's using
their Atari for Internet or serious work is using multitaking
(except musicians).
1: Don't even think of it, to make any economical sense, make it to
fit inside a ATX tower or any other standard pc case.
2: Look at the clones, the ports should be as much standard as
possible, so people can gat a new hd, graphiccard or whatever in any
pc store.
Forget all about GEM, maybe TOS in a chip to get the comp started if
all else fails. Ever thought about getting shares in the Milan
company? That would probably be a more direct way of supporting the
Atari market.

without
> real Atari TOS somewhere in the background?

No - it still requires some parts of TOS. There were ports for the Mac (MacMiNT) and a couple of industrial 68k systems. The mac port used JET (Just enough TOS). I think MacMiNT was abandoned a while ago.
These projects were either written to show "that it can be done" or to run some text-only applications like GnuC.

>If so, it should be possible
> to port MiNT to peecees and Macs (in the very same way Linux has been
> ported from Intel to PPC and Alpha, etc.).

I don't think there would be any advantage having MiNT on a PC. At least you will always need an emulator on the PC platform (which already exists: STemulator+MultiTOS bundle).

Greetings,
Matthias.

Don't you have a manual with your ST? The pins
are labelled at the back. Pin numbers are usually
numbered looking at the port, not the plug. Pin 1
is top-left, and pin 4 is top-right. GND is pin 13 on
the bottom.

> 2) Is the video quality any good? I assume it would be fairly clean (easy

That's incorrect. I've seen numerous TOS 2.05
Mega STEs with 1.44MB floppy drives.
Conversely, my TOS 2.06 machine was shipped
with 720KB drive. The other thing is the TT
uses TOS 3.0x, not 2.0x.

Hardware components are not particularly hard to find on the web. But
hardware components should not determine the computer. Jared should
figure out what sort of performance he wants (in detail) and then visit
the supplier web sites to see what components match this standard.

Again, this is basically what happened to the Milan team. It is
amazing how much I agree with you yet come to such a different
conclusion. I think 200 - 500 people would be interested in a new
Atari unit, but it would have to be more than we now have at a less
than ridiculous price. According to the Milan team (if I translated

the German correctly), they could build their computer at $2000, but people only wish to pay in the low $1000's. Besides, what the masses have spoken about is primarily their lack of confidence in Jared. Some of these people (Jo, Lonny, Dan, to name a few) have devoted hours of service to making the Atari/TOS experience better for all of us. When a rank newbie (and I mean rank; he doesn't seem to know anything about the current state of Atari user interfaces) posts a hundred messages asking us to rally behind him, patience can wear thin, particularly when he hasn't done his homework.

The two other main contenders? Are you refering to Draconis and Wensuite?
Don't be ridiculous, the APIs of both MintNet and STiK are publicly
documented, whereas STiNG shares the STiK one.
I vehemently agree that there should have been a TCP/IP standard defined many
years ago, but ASH releasing their own stack years after the others is just
inherent stupidity, and a Microsoft-like sense of business.

Sorry for the length of this posting, but I'm getting fed up with those impossible dreams that's discussed from every possible angle and without any relevance to reality, so I have some things to say.
Give room for realistic discussions about real projects instead - and give room for those in need of help. Otherwise there's a risk that people stop reading the newsgroup due to too many irrelevant postings which they have to download.

> Ok, I apologize for my ranting and poundings. I'm just frustrated that it
> seems everyone is "content" to live in a world where Atari is no more and
> the last vapors of life are fading fast into oblivion.

Face it: Atari is dead! They died because of market issues. The Amiga market became MUCH larger, but it's also dead as a rock nowadays - also due to market issues. The old machines have a relatively small group of people still using them because they want to see what's possible to make them do with various fixes and patches. Some users just continue using the programs they've always used and don't see any meaning in making any upgrades or change of platform since their system works the way they want them to - and they're not likely to spend anything for a new Atari machine either.
To try to get a big enough customer base out of such a small market would be financial suicide - and to tell all PC- and Mac-users around the world that an unknown, completely different platform is better than their current one, even though it lacks all the programs they're used to and almost only has spare-time programmers active - that wouldn't convince even the most foolish.

> You can support and program for the Atari of yesteryear, but ask
yourself...
> where is it going to end up in a few more years? Eventually, the clones
> won't even be Ataris anymore (what with how mutated the OS is nowadays),
if
> clones are even still made by then.

What you're suggesting is to take a design of today (the PPC) and start developing a new "Atari" computer around it. That's a huge mistake, since your development will take a couple of years (at least if you can't spend a huge amount of money on forming a new company and hire a lot of people for developing the thing) and you probably won't be able to find the most important parts at all by the time the development is finished - the PPC will simply be obsolete and impossible to get hold of when you're ready to start serial production. Intel have immense resources and lots of professional developers, so they double the CPU speed in about a year or so - so you can't compete with their market. Where would you be in 2-3 years if you plan on using a PPC of todays' speed? You'll need to design both the

CPU and the motherboard very tightly linked - or you won't be able to make them run together.

To try to develop a "new" old computer would be totally meaningless.
To even for a minute believe that Hasbro has ANY interest at all in investing lots of money for developing a new computer when their focus is games - and to think that they wouldn't care about getting any profit out of the deal - is nothing but dreams.
You must start to realize that the main market is spelled "PC" and some amount is spelled "Mac". Both PC and Mac are old, very well-known systems that people can rely on and the development has been active for many years for both platforms. To try and introduce a new platform, which is completely unknown other than to the still remaining enthusiasts, would lead to nothing at all. Noone would buy it unless it's extremely cheap - and to make it cheap, you need LOTS of customers. Then there's the problem with software. You can't run Office on an Atari - and that's what most people use at work - and due to this fact, they naturally want to use it at home too. Do you plan on making an Atari version of Office? Do you have any idea about how much time such a project would need?

"I've never liked "backward-compatibility" when it affects "forward-design", which it, invariably, does sooner or later."
This is a very well put quote from your own website. With this quote as a background, I simply can't find anything logical about your plans to revive the Atari by developing a new, fast machine to be able to run the same old programs?!?! If you plan on remaking all programs too, you need a couple of decades if you don't employ a lot of full-time programmers to do it - and if you don't develop the software, you won't have any use for your new, shiny "Atari PPC".

Maybe it would be better worth your while to develop a really good emulator board for the PCI bus instead? Then both PC and Mac users would be able to use it and you're not that much depending on the computer's speed since the PCI bus uses certain standards for the communication, so it wouldn't be as critical when it comes to development time, since the PCI-bus will probably stay for a very long time. The host computer's ports, CPU, RAM HD's etc would be used and the midi system and cartridge port would probably have to be on the emulator board.

Many people have strong feelings for their computer and that's something to respect because it's a personal thing, but to try to convince others to do the job of developing your "innovative" idea because you want a "new" Atari and claim that you're the only one looking forward is simply not true. Since you're still looking forward to developing a new Atari, you're actually looking way back instead. I left the Atari platform because I felt I needed something better and modern that gets developed in the future too, and is upgradable when needed - and as I didn't want to bet on a loosing horse again, I went for the PC. It took a couple of years to realize that the brand name isn't important at all - only that you're happy with the tools you use and that the system is stable. Of course, I could have chosen a Mac instead - but it's way over-priced compared to the PC and there's next to no

shops around and I don't know anyone who's really knowledgeable about Mac, so the PC is better to work with. Besides, there's more software available for the PC, so the Mac is actually another "loosing horse" in my eyes. I struggled against the stream about 2 years too long with my Falcon before I realized that it was really a dead end due to outdated hardware and software - for my needs and wishes anyway.

You can't expect that development takes another direction just because YOU want it. It's like when video was new. Betamax and Video2000 had a better picture quality than VHS, but see what happened because the "software" (rental movies) had better availability for the VHS "platform". Would you start shouting about making a new Video2000 video today just because you know it was better back then?
In a couple of years people will laugh about VHS and wonder how they could ever stand using it, because when recordable DVD's come to the consumer market, the end of the VHS market is close at hand due to the better quality of DVD. Just about the same now, when vinyl is almost extinct and the CD has taken over the music market completely - do you ever think about that? The DAT never became a consumer hit because the technology used is too expensive, so it's only used in music studios (small market and expensive units - somewhat like the current Atari market, only extremely much bigger). DCC seemed great when it came because of backwards compatibility (the players could also play standard tape cassettes), but the MD was easier to handle, so that was the market's choise. Would you try to go against the market and start fighting for a renewed DCC because you want backwards compatibility?
The world is constantly in motion and your ideas about renewing the old Atari (R.I.P.) platform are outdated, so give it a rest and try a realistic project instead - instead of chasing shadows of the past...
Look forward! Other platforms won the fight (not that there actually ever was a fight between PC and Atari, but anyway), so there's no meaning in taking up a hopeless fight against them unless you want to look like a modern Don Quixote...

Jared!

I have read you voluminous postings for the last few weeks, and am
really puzzled by your attitude. You take the view that the 'Atari' name
is God and the be-all and end-all of things, and a machine built by
anyone else is somehow less respectable. That sounds to me like
nostalgia or Atari-worship as a disease... In any case, Atari itself was
sold several times and so did not keep some sacred original identity
that seems to be infecting you.

>You can support and program for the Atari of yesteryear, but ask yourself...
>where is it going to end up in a few more years? Eventually, the clones
>won't even be Ataris anymore (what with how mutated the OS is nowadays), if
>clones are even still made by then.

I think you must realise by now that you are in the minority of one on
this. Most of us couldn't care a hoot about Atari /as/ Atari - it is
what the computer *does* that matters. I stick with Atari because:
It is fun,
I have an enormous collection of software,
It does most things I need/want (apart from web browsing that need Java
applets a.s.o.) even if it a little slow for large graphics etc.
It is very stable,
I don't want to learn a whole new way of using a machine and have to buy
new software for it.

That's why your PPC 'Atari' is a useless dream - unless it runs most of
the existing GEM applications, nobody will want to buy it, specially as
it is bound to be dearer and slower than current PCs or Macs. What
incentive is there for a buyer? There is nothing magic in the name
'Atari' nor are more than a handful of people likely to be attracted to
it. Current PC prices are only so low because they are produced in
millions - at least most of their parts are. It is volume sales that
allow a high-spec VCR, for instance, to be sold for 120 UKP where the
quoted replacement cost of a head drum for an older machine (without
fitting) is near twice that!

And while I like the look of the ST and Falcon, both of which I have
used for years, the design is too limited for hardware extensions to be
fitted that will be required continuously if you expet to keep up with

the functionality of software developments on the PC platform.

It appears you don't have an inkling of development and manufacturing costs. Even the mould costs for a case would run to many thousands of pounds/dollars. There is absolutely no way your PPC Atari could be a commercial proposition, and I think it's time that this line of postings was terminated.

On a more general note - can I plead with people in this group to cut down on the quoting? It really isn't clever to quote hundreds of lines including the sig - it should be easy to cut out the verbiage and only quote the minimum for people to be able to follow the discussion. Many of us have to pay for bandwidth or download time!

If they don't work on all PCs either, and they didn't warn you of this,
then the shop should take it back. You have rights under the Sale of
Goods Act as it is obviously not 'fit for the purpose' for which it was
sold.

: to 16MHz, but is not guaranteed.

Why I have had three TT030 motherboards is a long story, but they all had WD1772 chips with the 02-02 suffix, and I have the same chip in an ST or so with 1.44 drives. That is not the "original" one, which might or might not work, and much cheaper than the AJAX chip. No explanation is available for this. The original, I think, had a 02-01 suffix, and that one was iffy at 16 mHz.

I have about a dozen of the 02-02 kind, if anyone needs one.

I'm running quite fine on an '040 Amiga, the '060 is great, albeit expensive.
And it's always a bloody deal better to support existing developers with
existing goods rather than wait for Mr. **** and Mr. Falvo to come up with the
PowerPC dream. I think Lonny should be commended for actually upgrading, a
seemingly rare thing in the Atari community.

>Just how far do you think your Hades060 is going to take you? 5 years down
>the road? I seriously doubt it. With PowerPC, the roadmap is not only much
>longer, but a WHOLE lot faster...

A /whole lot/ faster? Have you seen WarpOS's 68040 emulation? It's not very
fast. Usable, yes, but fast, no. Not compared to an '060.
You're correct in that the '060 is the dead end in 680x0 computing, but there
is nothing speedier on the Atari platform, and in that case, it's very
sensible to actually upgrade to an '060. At least it's available and tangible,
unlike vapourware PPC solutions. Besides that, you'll have a blazing TOS
machine.

>I just wish someone else, other than myself, would see it and begin working
>on it! *sigh*

Porting the OS would be much more productive. See AROS.

I am almost pissed at Jared myself. In all likelyhood, if the atmosphere for such a project weren't already poisoned, he has single handedly done it himself. On the other hand, if his enthusiasm is guided a bit maybe something useful could happen. If nothing else, it's the funnest way to get rid of fools who think they can do more than they can. "Just go do some research, and submit reports on every single chip in the 74xx series, none of which is less than 100 pages, and I'll help you with the next step of designing your atari clone."

>computer division.

I don't quite remembe where I'd read about it; it may have been in a
press release or an interview. I can't recall exactly. Anyway, the
whole issue may become moot. A recent report shows that Hasbro's
Atari and Hasbro Interactive computer games division's sales are doing
worse than they had expected -- and they've already lowered their
expectations. Word now is that they may just be looking to sell off
their computer gaming division (and so Atari with it). Full story is
at http://www.well-rounded.com/games/news/news.php3?storyname=ahhasbro

Anyway, as to the whole issue of a 'new' Atari, don't get me wrong.
I'm not trying to shoot down your ideas out of sheer pessimism. i am
trying to maintain a semblance of realism here, however. As much as
I'm all for flying in the face of seemingly insurmountable odds, the
real facts of the matter paint a pretty grim picture, indeed. Suffice
it to say that the chances of success would be infinitessimal unless
it became a group effort of numerous enthusiasts who are in it more
for the love of Atari than for any idea of large profit margins.

If, however, this does manage to get somewhere I'd be quite interested
in seeing the results. :)

Atari made a 5.25 SSSD (Single Sided Single Density) floppy drive in the mid/late 1980s for the ST. (The model number "PCF 554" springs to mind)

I never saw one up close, but recall seeing mention of it in price lists and magazine adverts for the ST systems.

(It might've been able to connect to then-current x86 systems, but that is pure speculation on my part)

I just happen to have a extra original copy of Operation: CounterStrike
Mission Disk for the Spectrum HoloByte game FALCON for the Atari ST.
Requires the original Falcon game.
Comes with original manual, folder box and original mission disk.

Make offer.
Open to trades.

Anyone happen to have an extra copy of the other mission disk?

Join my club Peter, there's three or four others in here who are rapidly
tiring of trying to read an entire quoted message, only to find a "me
too" at the end.

Can we have a little discipline when replying to messages people? If
you're responding to a particular point in a message then just quote that
line. If anyone has the slightest interest in what other points that
message had to put then they can use the threading function of their news
reader to go back.

4725. No I haven't

Newsgroup: comp.sys.atari.st
Date: 2000-10-27 09:36:05 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <39F94C85.72D600CA@patent.gov.uk>
Source record: 55504

Hi all,

have just received an e-mail from a guy who read my last message to Derryck Croker, as saying I had translated the Cecile docs. For avoidance of doubt, I repeat what I said to the enquirer:

"Sorry to disappoint you, but what my message to Derryck meant was that I thought his general suggestion of converting any foreign language doc to HTML, and getting Systran to translate it, was a very good bit of lateral thinking. I have not got Cecile as I have not got Centurbo. I am sorry to have inadvertently mislead you. I have used Systran for several years. It is by far the most reliable on line translation engine. Others may translate better, but they only allow a limited amount of translation."

Bob King."

As God said in his last message "Sorry for any inconvenience caused"

Bob King.

Hi xlator<Peter>

Ok giving all credit for the original work to ATOS, here's the machine translation of the first interview. 2nd to follow:

"Milan II on ice put!

Interview with Ali Goukassian

By Thomas Burow

The message hit in Atari sets like a bomb: The Milan II is put on ice!

To this topic we led a detailed interview (length approx. 48 kB!) with the managing director of the Milan of computer system Ali Goukassian.

ATOS:
To 10.10.2000 has you on the web page of the Milan of computer system admits given that the Milan II is put on ice Why did this decision come so late?
Ali G.:
The fact that the Milan II in the planned form would have to be possibly put on ice appeared in September, when the components mentioned, which admits for the final manufacturing necessary and from the Milan I ago is, were not to be found partout. We considered and calculated then still some weeks, there which opportunities of evasion could be and are finally come to the well-known result.
ATOS:
Why did one hear in the time after the fair in June 2000 up to the publication at 10.10.2000 the so little of the Milan? Wouldn't it have been more meaningful to give themselves opposite the Atari Anwenderschaft information-joyful and constantly report on the situation?
Ali G.:
Afterwards regards perhaps already. But I tried it each individual user, who wrote me or called me, to clarify: During the implementing of a as extensive project as the Milan II it comes daily to events, which can mean a complete turning turn of the route of march.
Thus we would have fallen the users again and again with good

and with bad messages into (as promises the
one which can be interpreted) euphoria or into unnecessary
uncertainty. Even etappenweise analyses would
have continued to help to us there not.
ATOS:
In the outputs 8 and 9 the ST computer, also
by your page, still largely by the Milan II one reports. Why
didn't you already step here more briefly?
Why nothing was there from the problems, which already existed?
Ali G.:
The problems, which at times of the
interviews (one considered printing lead times, the delay of the ST-c)
occurred, we could also solve thanks of
recruiting additional personnel after troubles. Explicitly for example
the binding of the diagram is here meant.
ATOS:
In your statement you write that there were
technical problems again and again. So for example with the
integration of the AGP port and the SDRAMs.
Why did one use not already substantially in
former times these modern techniques? Why were running out
standards used again and again?
Ali G.:
Without a doubt an error - I must admit that
here. In addition, for this there is a reason, although no apology.
In particular the integration of the AGP port
or the SDRAMS is more aufwaendiger around a multiple than
the standards used of us. If one itself times
comparable projects - and thus I do not only mean Pendanten on
TOS base - it looks at then one sees that to
same places the modern technique one goes around again and
again.

As said: To solve is everything, but it is
also a question of the time. We are not a company such as Siemens
or Intel, the short hand of 50 engineers for
a project from different areas to store can, in order to operate with
full one power on it. With us soon a result
had ago, which seemed portable from our view.
ATOS:
A last large shock was according to your
predicate the adjustment of the production of an important logical
chip. Wouldn't one have had to count during
the today so rapid hardware development on it? Why were no
alternatives considered to this chip?
Ali G.:
The time is a large factor also here.
Comparable never gave it. Of the portability at least not. **time-out**
as
the the technique 1997 begin develop, can

miss we not so much time, a a suited board develop. As I
mentioned in my statement, us the
manufacturer assured at that time also in writing an existence of the
components to at least at the end of to 2000.
To that extent we felt also really weighed in security and saw
ourselves no veranlassung of considering in
the anyway limited time alternative possibilities from the
beginning on the board. Today we do not have
any as a mini company with our demand after keeping the
promises naturally handle. There one is only
smiled at with the Big Playern. A trueful niederschmetternde
experience...
ATOS:
In your statement is to be also read: It
always gave doubts whether a 80-MHz-Computer can become
generally accepted and whether it would be
enough to use a main processor become outdated
technologically hopelessly. From where
suddenly do these doubts come? Why didn't one set equal to
beginning of the project on modern hardware
(e.g. PowerPC)?
Ali G.:
I did not express myself here precisely. With
always doubts I particularly meant not the point in time of the
invention of the Milan, but the passed months
before the planned market start. I ask to excuse the precision
lacking here.

The reason not to set on PPC hardware was
situated simply in the fact that us the idea with the Linux core
had not come at that time yet and we knew
that with the existing personnel cover an additional expenditure
of at least one year would have been
necessary, in order to bring something substantial on PPC base to
running. In addition, for this there were
discussions and considerations naturally for hours.
ATOS:
Did you really believe to last in a success
of the Milan II?
Ali G.:
It is not 5 weeks ago that a large retail
chain inquired with us, how it would be with the Easy Computing
system now. One has interest to apply it for
the Weihnachtszeit strengthened since the current at computer
beginners is still unbroken. That was only
one of many messages with us. And if one gets evenly such
supplies submitted, then one can believe not
in a failure. From my view it makes sense in no situation in life
to execute something in which one does not
believe.

ATOS:
Does the end of the Milan II have to do
something with its new operation field (Mac magazine)?
Ali G.:
By no means. Who knows me personally, it
knows that I operate rather 80 hours the week and induce me on
various fields to give than me with the 40
standard hours with a thing contently. The Mac magazine (see
http://www.mac life.de is planned since the
CeBit'98 and is put again and again on ice and again taken up,
until the point in time appeared meaningful
to us now. Here I have however very much work stored externally
and primarily my 6 years experience in
Verlags-und editorship nature flow to let.
ATOS:
It is surely not easy in the today's time to
develop a new computer system and to marked out, but there were
announcements, which were not kept again and
again on the part of the Milan of computer system.
Do you mean that you disappointed the
confidence of the Atarianwender
Ali G.:
If, then I ask this to excuse. I hope that
however in particular the developer team the respect for achieved the
so far is gezollt. There are not nevertheless
many companies and teams, which created it so far to place a
computer system executably on the legs. I
think that the performed work to date grandios is. If one considers
the fact that a few intelligent headings
develop a hardware there on the Atari software runs, then is out my
view a master performance, before which I
have personally my respect.

See: There are companies, which get a
comparatively small software with a dozen of programmers only with
many, many bug for running, although them
were programmed over one year long to it. Our developers took
up a much larger fight. They had to develop a
completely new hardware. And they had to umstricken an
operating system become outdated merciless so
much, until it ran on the new hardware. And to better last
the large function consisted of arranging
executable as much as possible the old programs on this new
combination.

I hope thus, not completely, but only on an
intermediate stage to have disappointed.
ATOS:
Can you understand users, who remain no
longer faithful now for the Atari, because they want finally
somewhat strong?

Ali G.:
Naturally I can understand that. I was always
a large fan of the modern Atari operating system (MagiC,
N.aes) in combination with an extremely small
core, which was not based on thick breaking into such as
Windows or MacOS. But clearly it is also that
one would like to feel modern hardware under the fingers.
That we could already have shown ansatzweise
with the Milan II. The Milan I meets these desires however
surely only insufficiently.
ATOS:
How do you want to repair the confidence of
the users and which to want them in your public relations to
possibly modify?
Ali G.:
Glossary word cards: I mean the open cards,
with which we will play. We must find only one way to stop,
how we spread new in such a way that it is
understood not immediately as promise or failure. Then we can
always supply a status report. I think that
the Web must thereby large playing. It will give now at least every
two weeks to News on the Milan Site, which
fell asleep little nevertheless in recent time
ATOS:
According to predicate of software houses the
advertisement caused a being missing of the conversions on
the part of the Milan of computer system over
the Milan II software package? Often it occurred on fairs that
users the software of the manufacturers let
themselves be shown, then however said: to ", only I will not buy
it property thing - it participates in the
Milan." This status pulled itself by always new promises over one
year into the length.
What do you say to the reproach?
Ali G.:
Actually a large problem. And we would also
have publicised in this form, we would not have been not safe
that it folds with the Milan II. As said, we
suffered the neck break not due to the problems, but due to a
surprising event. Everything else would not
have been conscientious. I personally was never a large fan of
to extensive Softwarebundles and pointed
again and again on the fact that the software industry of a Milan
II would have to live. But I had to be able
to be sold also the argument, an other system only with extensive
software well, again and again struck give. I
hope that this bad state can be compensated by the official
proclamation on the part of Milan computer
system now a little.
ATOS:

There was also the reproach that there was
few interest in the Milan I last, because the Milan II was
announced and the Milan I was not greatly
mentioned any longer. After your statement customers ask I.
only now again for the Milan
What do you say to it?
Ali G.:
Tja, which I am to say: Somehow it must also
make me happy, since we must gain urgently an income. Being
missing sales met us also very much. Milan
computer system is an economically normally functioning
enterprise, which must gain conversions, in
order to be able to survive. Actually the demand now again
lively and assumed satisfying extents. For
the entire team this means also that the topic did not die by any
means. That makes us happy in the current
situation.
ATOS:
Can it did give contracts with programmers
and quit these programmers the contracts because of disregard
of the date?
Ali G.:
It gave no final Milan of II contracts. This
area was always task range of our distribution partner, that - for
understandable reasons - only then to the
written ratification to come wanted, if the accurate plans are.
ATOS:
What now is the " cooperative one " with
AXRO, HP and Motorola after the from for the Milan II with?
Ali G.:
AXRO is still fully behind the Milan project,
which is to be justified which many of the national and also
international inquiries are received after
the Milan directly with AXRO. Thus there locally still permanently
one implements, which already exists demand
without acquisition expenditure. HP will strengthen us also
further the backs, because there is no cause
for any retreats there. Their willing to cooperate shank is surely
also pragmatically justified. With Motorola
we must look, into to what extent co-operation still mandatory
necessary is, if the future hardware is
completely available acquired by us.
ATOS:
There were now already some announcements
relative Amiga plays, which should be portiert on the Milan.
What becomes now from it?
Ali G.:
At present this Portierung is continued to
continue, since the expenditure necessary for it is comparatively
small and also the Milan I already offers

sales prospects. I heard only of 2 projects, which were put
temporarily on ice. The readiness to take up
these however again is in any case available.
ATOS:
In the assertion of 10.10.2000 report you
also of the further plans of the Milan of computer system. It is the
speech of a project, which was drawn from the
developer drawer.
About what does it concern itself thereby?
Ali G.:
My quality, in addition I could express in
many pages.... will however try to seize me briefly. And perhaps a
or other reader wins the feeling for the fact
that we considered but also into the future looked not only the
implemented.

We always planned to use the strength of the
TOS. This is situated not in the modernity and the function
range, but in its size. And TOS should run on
a long-term basis not only on the Milan II, but also on
Webpads (for those concepts were already
developed) and other devices. Thus it turned out already
promptly that we had to become on a long-term
basis independent of the hardware. A substantial part of
each operating system is however that part of
the OS, which is designed for the hardware of the appropriate
computer which is under it. Already the
adjustments of the TOS to the Milan i-hardware stressed months.
The same problem had ASH at that time already
with the adjustment of MagiC at the Falcon.

Thus we prepared a concept, with which that
area of the TOS with only few KB is replaced a large Linux
core. This Linux core is to manufacture
communication to the processor and the remaining hardware of a
system. The advantage, which we see therein,
is that there are Linux adjustments for some processors and
that for any appearing new hardware interface
(USB, FireWire etc..) Drivers within shortest time as open
SOURCE are available. Why should Milan
theteam again and again develop new drivers in long and
laborious work, if it can fall back
nevertheless simply to existences?

Thus we compiled a symbiosis from Linux core
and TOS, which are more modern and more flexible than each
TOS existing so far - perhaps even OS
ATOS:
The concept with the Linux core sounds itself
well, but then still concerns a typical Atari operating system?
Ali G.:

Yes! No question, because one may not the
error make here to believe it on a computer a Linux was installed,
in which a window opens and an emulation
runs. The TOS has already in the current form a
hardware-dependent and a hardware independent
section. Likewise it is with MagiC. One must understand
this depending on hardware section simply as
a type air-lock or interpreter, which interprets the inquiry of
the software running in each case (and in
addition the Desktop already belongs) into one for the hardware
which is under it.

Now, Linux has evenly also small, 200-300 KB
a large and comparable core, which is exclusively for the
interpretation of hardware communication
available. We avail ourselves only of this core - no more and not
fewer. And we do that only, because this core
for so many processors is available and because in this core
also interface drivers, fixed disk driver,
network driver etc. are based.

Already now the TOS core modified strongly in
the Milan I (which does not see by the way at all one; -)
simply one exchanges. The user does not
notice anything and the operating system is at best 200 KB more
largely than before.
ATOS:
The sources of Linux are freely available,
but not free by copyrights. In what respect these copyrights
concern the project to put the Milan OS on
Linux and as one will have oneself to present therefore this
symbiosis from " Public License " on and to
the surely commercial part of the planned operating system on
the other page?
Ali G.:
These questions are clarified at present for
us in the USA. There are world-wide after my current level of
knowledge still three companies, which
operate on similarly modular ideas and concepts. These create it to
completely get along without violation of the
copyrights. And we want to follow the example.
ATOS:
If one relies on a Linux core, doesn't one
make oneself then dependent on other developers?
Ali G.:
But, surely. But of it there are zig
thousands, while the Milan team is small. I am not a developer, can
however after the many months of co-operation
with developers almost a song of it sing, which for a
giant-large expenditure is already it to
write a driver for responding USB port. For Linux these however still

appeared during the phase of the
establishment of the interface standard.

And the situation speaks for itself: On years
no abort of this Linux upswing is in prospect, if I do not believe
also that Linux will be able itself to
intersperse ever as Home OS.
ATOS:
What notices the user of the Linux core?
Ali G.:
As previously mentioned: Nothing at all,
because Linux are completely deeply in the core of the TOS hidden.
ATOS:
Is the user confronted with the installations
new hardware with Linux?
Ali G.:
No, not at all. The primary target to keep
TOS small is kept. TOS is to still fit on an Flash EPROM and be
within fewer seconds there. But in place of
the TOS Bootblocks, which detects the Milan hardware, this will
make the Linux Bootblock. We could also have
concealed Linux or already now in the TOS have been able -
nobody would have ever noticed it. It would
have been surprised only everyone, why TOS suddenly runs
on a Playstation II (small fun...).
ATOS:
Will usual Atari programs on the new system
run or are adjustments necessarily?
Ali G.:
GEM conformal programs, which do not make
direct hardware accesses, should run. Exactly the same it is
also with the current Milan, that - as
previously mentioned - a completely renewed TOS core has. But this
point must be mandatory ensured, otherwise
nobody will be able to guarantee for the fact that a program on
all platforms will run.
ATOS:
Do programmers, who want to program programs
for the new system, from reason have learn again (above all
which concerns the programming of hardware
accesses), in order to develop executable software?
Ali G.:
No, they must adhere only to the proven,
which in particular in the early Neunzigern not yet in was. Who
gets software on the Milan I for running,
this should also on the new TOS.
ATOS:
On which development time you count, until a
first executable version of this new operating system is
demonstratable?

The speech is of a publication in the first
or second quarter 2001. Is a realistic specification or a
practice-substantial estimation, which is to
keep the users particularly?
Ali G.:
The predicate is a first estimation. I think,
we toward end of the yearly first representative versions will have,
which one cannot only show under largest
expenditure an select public. The experience showed that it is
ready for the market one from already
inspiring a first sight to however longer away. Finally it is not enough
with such an OS to bring many programs, which
should run, also to running. All must be. One point, which
joins, is that we look further financial
sources up. This time we dare even the branch over the large pond, in
hope to discover with the new concept open
ears. The more capitals is available, the faster will be able to
operate we. Details will have to be inferred
from the regular updates of the Site.

Also it plays a role, as our present
negotiations with the hardware licenser run. Results are to be expected
also here only for in the middle of November.
All in all the estimation should be however balanced.
ATOS:
How far is the status of the development?
Ali G.:
A first version was not to be seen already
recently, it ran however instable and also still long on each
hardware. Nevertheless, the transformation
folded.
ATOS:
Which hurdles have to still overcome you up
to the completion?
Ali G.:
Our 68k-Transform-Engine ï¿½ must run perfectly
and an interpretation interface with view to future, possibly
occurring hardware standards must be created,
so that TOS can exist also on a long-term basis.
ATOS:
Also were factors considered, which could
bring this concept to coming to a hold?
Ali G.:
We have, however I admit gladly the fact that
we are to the present point of view in a still recent stage and
only after an official hardware co-operation
an accurate schedule becomes schmieden to be able.
ATOS:
Many users are dependent to use a second
platform. Will the new operating system enable the parallel

operation with a second operating system
(e.g. Windows)?
Ali G.:
If a Intel platform is the basis - yes. Since
on a standard Intel platform however no sufficient Flash memory is
available, this version then probably becomes
with a PCI card or something comparable one delivered, on
which the OS is. If it should come to the
Lizenzierung of the non-standard hardware, then runs first excluding
TOS on it.
ATOS:
Who develops concretely now? Who takes over
the programming work? How are the functions distributed?
Ali G.:
The past team is involved into the thing. In
addition come the possible hardware licensers, that will take over
a certain part of the work. In addition, it
is to early before termination from contracts here, in order to say
details.
ATOS:
Is a software package planned? What is to
contain it?
Ali G.:
It could be comparable with the old Milan II
package.
ATOS:
The present Atari software market has so some
lack and gaps. For example a competitive InterNet software is
still missing. Unfortunately there are not
also many products, which are developed further or again
developed.
How do you want this trend to stop and for
new innovations provide?
Ali G.:
A question, which prepared for me also
headache and prepared. Here and falls everything is with the
necessary capital. Developer for the
adjustment of JAVA, Flash etc. gives it meanwhile, but these must be
paid. Otherwise we must get along first with
the existing, in order to see further with the gained one. Which I
will force however in any case, is the
binding of SSL, so that elementary functions are secured like the
Homebanking.
ATOS:
Will you support program products of external
developers and as do come interested developers at
documentation?
Ali G.:
After termination of the exploratory
discussions in November we will be able to mark out, as developers are

to be supported best. I ask then for direct
contact with me
ATOS:
Which concrete supplies does Milan of
computer system make for interested programmers?
Ali G.:
At present none. We can offer or guarantee
financially nothing. I set on the fact that we state to interested
developers in the context of silence
declarations/agreements at the beginning of 2001 the status of the
things openly and them thereby the
possibility give to consider whether it could pay, a software to offer
or
not. If everything should fold, it might be
interesting, a compiler/translator, a good diagram often commodity
or to offer whatever for an operating system,
which runs medium-term on various platforms.
ATOS:
The speech is also of the Milan III, a new
hardware project. Is it to be placed in the today's time meaningfully
its own hardware project on the legs?
Ali G.:
No, is not it. We took the Milan III as
synonym for the device, which is offered to us at present as a
manufacturer PPC computer. If it should come
to co-operation, then we have a super interesting device - a
genuine ST new millenium.
ATOS:
Is it not better, if the new operating system
on as broad a hardware pallet as possible functions, speaks the
purchase of a standard PCs is sufficient? Or
can't that be implemented so fast?
Ali G.:
But, as already briefly suggested however
only with restrictions. It will be surely possible to supply a
version which runs according to standard, but
to become we this version subsequently to supply to have.
Because a CD ROM was presupposed here crammed
with drivers for the most diverse system for installation.
Finally we put neither on Windows nor on Mac
OS. And before this is completed, we will offer or will
recommend select hardware.
ATOS:
Which configuration is the addressed Milan
III to have and which price is anvisiert?
Ali G.:
If we should fall back to standard hardware,
then we fulfill - that accordingly - all current standards. And
even a possible PPC version is on the newest
status of the things. Regarding the price we must undercut

one iMac for example despite the new price
structure. That should be our target, if we focus a new ST.
ATOS:
Many manufacturers of hard and software
regard nowadays their technical logs as secret language. TOS
systems however had usually documented
(probably, because they originate from a time, where was still
usual) very well and also analyzed. For
tinkering projects (one thought of the many STs of universities), as
also for commercial applications (for
instance with applications of real times within the music area), thereby
functionality could be guaranteed. Through it
that one separates with Milan of computer system from its
own hardware, isn't this advantage lost?
Ali G.:
With security this danger exists. But how
many people tinker today still real at and with their computer? The
times change, and from my view it does not
make for much sense to hang in such a manner on the old times.
The field of application of the Milan will be
primary to look up in the home user area. It would be a
contradiction, if we would offer an a riser
system, also particularly, for example for tinkering is almost
suitable. We must draw a clear trennstrich
here and look ranges of application up, in which it is of advantage
even that the operating system on so many
hardware platforms can run.
ATOS:
The ATOS had already referred to Mr. Martens
of AXRO approximately one year ago the bad state of a
missing, competent and in any way central
instance for new standards. This would be however urgently
necessary, around such confusion - one thinks
of the number of available TCP/IP stacks - to prevent.
Do you see the same problems as we, here and
if, how a solution could look?
Ali G.:
I hope instaendig for the fact that we have
so many economic power by external support that we can
centralize the co-ordination. It is not like
that that we would not have seen the problems. But simply the
conceptions at personnel and worker, in
order, which we had from a central controlled instance and to have
to implement, were missing.
ATOS:
Will the Milan computer of system be able to
represent once this central instance?
Ali G.:
As said: I require it to me, because only so
we can guarantee a clear line for developers and guarantee a

uniform software cover for users.
ATOS:
Which target group would you like to address
with the new OS? Only or you want to get the pure
Atarianwender also new users in the boat?
Ali G.:
We will be surely strongly endeavored to win
new users. That is for economic reasons obvious.
Theoretically the new OS can - as it is as
small - on Webpads, bag PCs, home computers or also consoles
run. To that extent the potential is large.
It must be only used.
ATOS:
How do you want to achieve it that the new
operating system excites attention in the public?
Ali G.:
It was now noticeable that the glossary word
hardware compatibility provides by Linux in many places for
large interest. As soon as there is something
to see, we will step thereby to the public, in order to find also
license partners, which need an appropriate
operating system for their hardware.
ATOS:
How do you want to convince potential buyers
of the product? Which advantages want to place you into
the focal point?
Ali G.:
We will surely be able to represent no
genuine competition to Windows or Mac OS. This desire would
remain surely always a dream. One must
concentrate on its strengths. These are not situated to be as only
somehow possible as versatile in order to run
both on a Home PC and on a workstationworkstation
workstation without large expenditure. The
new operating system is sayful small. At present the developers
with 8-16 MT struggle, in order to bring
comparable software as under TOS to running. We create it with
everything drum and to (packed) with 2-3 MT.
Thus will we hausieren to go.
ATOS:
Are there already concrete conceptions for
the later selling and if as these conceptions look?
Ali G.:
It does not give unfortunately yet - first
the final product must be in detail sketched, become only then we
the selling possibilities to dedicate itself.
ATOS:
We thank you for the discussion and require
to you further much success.
Ali G.:

I thank also for the discussion - surely the
longest interview, which I ever gave. But I am pleased the
opportunity to have gotten to state in the
detail the situation that of Milan computer system.

4727. Re: Milan ?

Newsgroup: comp.sys.atari.st
Date: 2000-10-27 11:22:36 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <39F9657C.303E3A2D@patent.gov.uk>
Source record: 55506

Hi again,

as promised, here's the machine translation of the 2nd interview,
original credits as before:

"Milan II on ice put! - Part II

Further interview with Ali
Goukassian

Of Benjamin Kirchheim

After the interview with Ali Goukassian remained open
for Benjamin Kirchheim still some questions, which to it Ali
Goukassian answered fast, readily and openly. We would
like not to withhold this discussion from you, dear readers,:
Benjamin:
How does it look with the deliverability of
the Milan I? Are still sufficient boards or still which available
are produced?
Ali:
Yes, which runs production and I hope that
we can supply in 14 days again. That had to be geleiert now
at short notice again into the ways.
Benjamin:
I.e. the missing chips for the Milan II are
available for the Milan I? Or are other chips? I understand not
completely, why there are chips for the
Milan I, but not for the Milan II.
Ali:
The problem with the chip is that we have
still some hundreds - for the Milan i-paragraph is enough it,
but one needs not to let the IIer
manufacture even under some thousand copies. Otherwise Motorola and
others want to have much cash for their
chips viiiiel too.
Benjamin:
Ah, I understand. The need after a Milan II
has surely with everyone a concerning the price pain
threshold, there can one not measure,
whether one could sell e.g. 200 Milan II, for a very high price.
Harm, but one must accept that evenly.
Ali:
With a 200er edition of the Milan would
grow up the price unfortunately fast on knappe 3000, - DM. In
particular the board production of the

nevertheless many more complex board, in addition, the processor
would clean-strike strongly '.
Benjamin:
How does it look with the 68060-Erweiterung
for the Milan I? Is those available and which costs her?
Ali:
Available: yes! The empty card costs in
such a way around the 300 Marks. Processor prices are not at
present well-known me, but with luck one
finds within the Amiga area used...? Can be found out in
addition.
Benjamin:
Will it give still another more modern
diagram card for the Milan to I?
Ali:
Hmmm, good question. In the course of the
Milan II work we can initialize now each card. But it depends
on to what extent the work for the possible
new system is helpful to the Milan I. If then only partial work
must be carried out, then. Otherwise: - (.
But one may not really underestimate the S2 in the 2D-Bereich
also.
Benjamin:
But the S2 has nevertheless only 2 MT RAM,
or gives it also (available) 4 a MB version, which runs in
the Milan I?
Ali:
We test at present the 4 MB version of the
S3, which give it definitely. With luck that folds!
Benjamin:
From where are the " drivers to come for
the drivers " with the new Milan OS with Linux Kernel? Only
because the core USB can, nevertheless
still for a long time no mouse -, scanners - is, DigiCam etc..
Driver available. Who is to thus write
these? Will it give standard interfaces for such TOS drivers (with it
e.g. a USB Maustreiber for TOS all USB
Linux Maustreiber to respond can)? (USB is only one example
and can by video cards, diagram cards,
network cards, ISDN cards etc. be replaced.)
Ali:
You detected that perfectly correctly. It
concerns to us with Linux primarily the Low level drivers.
Everything that is put above, must again be
written. And there we must rely on the old, for the Milan II
initiated relations and contacts, which
promised appropriate work.
Benjamin:
From our discussion an idea, me results
your opinion in addition would interest for me:

I could imagine that enough (100-200) are
inspired Atari users, who would buy the Milan II also at a price
of e.g. DM 3.500. - or DM 4,000, - and that
them these to book in advance and a pre-payment out carry, so
that a small series is presented. Do you
hold for possible or you it would exclude, even if enough people
are? I think there of Rudolphe Czuba with
its CT60 or CT-tt, which he implements only practically, if there
are enough obligatory vorbestellungen.

I assume simply times the Milan is finished
II. A software package would also not have to be tied for
these people, it became the board to be
enough. Everything else (housing, RAM, fixed disk etc..) those
could procure themselves. It could
clean-get thereby possibly still another part of the costs again and
some users lucky make.
Ali:
We think times about it and eruieren we
times the situation... I must confess, it sound delightful... I
become times Uwe anhauen...

Yep. Utah Saints STILL use Ataris precicely because of this -- well,
not because it's cheap, but because it's simple, robust, and because
they don't NEED anything that more modern and complex programs allow.
I have to admit, I use Cakewalk, and frankly, I hate it. It's far
more complicated than it needs to be, it's rather unintuitive, and --
go ahead, just TRY setting it up to work with virtual softsynths.
"Pain the Ass" just doesn't say enough.

I wonder why that kind of people aren't running Mac. Mind you, they'd use DOS
if they didn't have Windows. They just use what they're used to.

Parity as opposed to EDO? That's true, I suppose I haven't been following the
developments lately.

>Furthermore, there are such variants as 33-bit, 36-bit (without single-byte

> 16-bit stereo DMA-sound though.

I often wonder just how much more powerful the TT is over the Falcon,
for "general" use rather than anything involving the dsp or highres gfx
modes.
I've got Patrice's version of the Doom engine and it runs about the same
speed on both my TT and Falcon. This is cpu intensive and doesn't use
either the fpu or dsp (shame), but runs about the same even though the
TT has twice the clock rate.

Maybe it is because of ram? My TT as 2mb ram and 4mb fast ram, whereas
my Falcon has a massive 14mb ram (not fast).

Curious, Steve :-)

ps, I know nothing of the hardware side, so here's a question -
I want to upgrade the TT's fast ram (not ST ram), by say another 4mb.
Where can I buy this from (how much?), and is it simply a case of
slotting in the chips into a socket? :)

Hi Claes

I'm using the PS2 adaptor that came with the Logitech Pilot mouse, and
it doesn't do anything. Strange, as your Logitech works fine, I would
have thought they'd stick to the same sort of standards throughout
there range. I give up - I'll just have to get a different one!

Yes, I rang up about 3 or 4 years ago, and the person on the sales
desk at system solutions said that it was "unavailable" and the only
over choice for the STe is the lighthouse.

That's what amazes me. I know ppl who forked out upwards of 4
grand for current clones in the past, but this guy is only
good for 150 bucks towards his own idea? I don't understand
his motivation at all since he does not even have what I
would call a solid Atari background. You and me have had
our small difference here, but you have a wacked out
Atari... that says alot about you. All good btw. :)
I'd listen to someone like that before I'd follow some stranger
with an odd GEM obsession, who wants revive the old ST casing.

Be prepared for a long wait, it will take me several years
to box that hades for shipment to you. :-)

>know how is to back up my own CDs.

You have every right to make a personal backup of anything that you own, nothing sensitive there..

>Using Sound Pools CD Recorder software, can Pley Station CDs be Backed Up?

But the playstation wont allow you to use these backups unless its been 'chipped', this device negates a hardware protection routine that scans the disk at boot.

I heard once that there's a massive archive of PD playstation games that for some reason Sony dont want anyone to know about, curious eh!, so you'd better get your playstation chipped in order to be able to play your legal backups and the PD disk once you've found them.

Surf over to here dude.

I would be glad if something like this (minimal TOS implementation) existed on Atari, too- for machines like ST and MegaST which have limited memory and low CPU speed. On my MegaST I usually use TOS 2.06 loaded into RAM.
If I load MiNT over it, applications still recognize that there is TOS2.06 beneath, so I suspect thet there is some difference compared to loading MiNT over older ROM-based TOS. But this arrangement wastes a lot of memory, as most of TOS2.06 is obviously not used. A modern set of (X)BIOS functions used together with MiNT would eliminate the need for TOS and free a good many kilobytes.

Another point is that this arrangement might perhaps be loaded into EPROMs, which would free even more memory. I know that it might be argued that people usually do the opposite- move the OS from ROM to RAM for faster performance- but it seems to me that on low-end Ataris the situation is reversed: it appears that the relatively simple hack that speeds the CPU to 16MHz can easily involve the ROMs as well- so the code running from 16MHz-access ROMs might be somewhat faster than the code running from 8MHz-access RAM.

>I offer a chance to change all that. We start fresh

Gee, you should have been a politician, with wording like this!
Unfortunately you don't seem to offer anything but confused ideas about
some unclear goal of an all-american, from sea to shining sea (appropriate
music playing in the background), revived Atari just for the sake of a name.
You want to build a machine but others should build it for you. You
want it to be new and advanced, and yet the same as the obsolete ST.
You want it to be named "Atari" and yet not be built by Atari because
that company does not exist. You want it to have specifications practically
the same as the clones have and yet it is not to be a clone. You want
it to be flexible to use and yet have a fixed configuration. You want
people to cooperate, design and build it for free, so that Hasbro
can make profit out of it (not that they would...). You want it to
be faset, and yet built around a rel;atively slow CPU that is probably
not even produced anymore. Etc. Etc... Really, only a politician can
come out with such a set of mutually contradictory statements and expext
thousands of followers.

People post here with all sorts of ideas about advancing Atari hardware,
including (why not) a PPC design, but it seems to me that, with this
insistence on some irrelevant issues, you insert too much noise into a
discussion that might result in some sensible approach.

I certainly don't understand your argument here. If I optimize a
program for the Geforce it may not run on other graphic cards. Then
another one writes his games especially for the Voodoo card.
So the user sits happily in front of his PC and switches between these
two cards...

You're not very wrong, the only published documentation on IConnect only
covers the (PureC-specific) socket library. The actual interface to
IConnect isn't documented, so you can't write a IConnect-compatible layer
to STiNG or MiNT-Net or even use a different compiler.

I know MacMiNT has been worked on recently.

> These projects were either written to show "that it can be done" or to
> run some text-only applications like GnuC.

There has been some talk about a fVDI-driver for Mac, but I don't know if
anything has actually been done. If it's realized it will give MacMiNT
similar functionality to MagiC-Mac.

> I don't think there would be any advantage having MiNT on a PC. At
> least you will always need an emulator on the PC platform (which
> already exists: STemulator+MultiTOS bundle).

There's a huge difference: STEmulator (or any other emulator for that
matter) runs on top of another OS (DOS or Windows). A port won't.

> I've got Patrice's version of the Doom engine and it runs about the same
> speed on both my TT and Falcon. This is cpu intensive and doesn't use
> either the fpu or dsp (shame), but runs about the same even though the
> TT has twice the clock rate.

Well, if you use the TT in normal video mode, the 320x200x8 bits
(1byte=1pixel) screen must be converted to the TT shifter video mode:
320x480x8 bits (planar). So I think it is the main reason that keep the TT
version from being twice faster than the Falcon. But Doom uses FastRam
when available, and 32Mhz versus 16Mhz helps. (I suppose that both
machines are the original ones, without any accelerator).

You're obviously not a programmer... Most of current apps, games or even
operating systems are so huge and complex that it's impossible to optimize
every little part of it. You sacrifice a little speed and compactness in
favour of more functionality, re-usable code and a more efficient
developing process.

> Why? Because they HAVE to! But do game players complain? No. They enjoy

I bet the developers do. And if you could upgrade the Dreamcast by
replacing the graphics chip with something that's five times faster and
costs 1/5 of a new console (like you can on the PC), most gamers will
probably appreciate that. Because it means more and better games.

Surely a port of GnuTella would be easier, since it's open
source ? The need is more pressing, given that CAB has trouble with
MP3.COM. (Well, _I_ have trouble with MP3.COM, it _used_ to work fine
with CAB 2.7. Grrrrr.) Audiogalaxy seems to work okay, though.

Since Napster can be shut down any time, I doubt that anyone would
consider such a project right now. An alternative is GNUtella, there are
several GNUtella-clients for Linux and I would assume that some of these
can be ported.

Hi jared

>Eventually, the clones won't even be Ataris anymore (what with how mutated the OS is
>nowadays), if clones are even still made by then.

Technicaly speaking, once my Mega has booted into Magic it is no longer a TOS computer anyway, its a Magix platform, the same as a lot of peop's in here, the same applies to MINT users, they are not atari's once the TOS has been dumped, just a clone of sorts.

Message-ID: <5YmK5.174$z93.32509@news.goodnet.com>
Source record: 55446

[Save newsgroup bandwidth and reply directly to me]

I have tried to encourage the masses to band together to help bring back a company that died unnecessary and to develop a new computer, based on a familiar design. But no one cares, or at least is willing to take chances with their time, skills, or money.

After all the rejection, post after post, I finally realize that it is ultimately pointless to strive any longer on this issue. And as much as I would like to do this entirely on my own, I realize that without the financial backing of protential system buyers, it's pointless to even design the system.

However, in examining some schematics for the 1040ST, I have learned some things I didn't know before. That all your data and address lines tie into one trace that intersects different chips and components. I learned that the Yamaha chip was used for the printer port (I kinda knew this already, years ago, but seeing it kinda surprised me). Why? Seems silly to me. And that the WDC floppy controller was used for the HD port also. It suddenly dawned on me why... that controller was probably an RLL/MFM chip... hence why you needed a convertor for using SCSI.

Things y'all probably already knew, but were interesting tid-bits for me to finally realize by seeing for myself.

The Atari 1040ST, though it was hampered from the beginning, was an interesting piece of design. I marvel how they used a sound chip for a printer port and two Motorola ASIC's for the MIDI ports, etc.

Apple has proven that a closed design is not a death-knell to a system or it's buyers. Apple still sells systems by the thousands. iMacs and the like. My roadmap to my "new Atari system" was as follows:

Phoenix H603e/B603e (H=Home/B=Business); based on the Atari 1040ST and Mega ST designs, respectively. The business system would be, naturally, more powerful (faster CPU, more RAM, better video, etc.) and include networking.

Phoenix II HG3/BG3 (G3 processor; more and faster of everything for both systems)

Phoenix III HG4/BG4 (G4 processor; same as above)

With a year or two between these systems, and a trade-in (old to new)/trade-up (home to business model) program for the users, with encouragement to communicate on a world-wide level... it would be something of an Atari that no one has ever seen before.

And sadly... probably never will.

Hasbro owns the key to unlock the door of which I speak. They must have *some* reason for holding onto GEM/TOS rights. Perhaps they are looking for a *reason* to use them. But it may just be that only by being shown how THEY can benfit from the transaction, would they be willing to do anything with them.

Sure, we're all concerned about failure, so we let the other guy do the trying. But you see, "letting the other guy" do all the work makes "the other guy" feel like YOU don't care. It's a variation of the flaw in Atari's plans (or the little red hen story, if you prefer):

1) Atari: We don't advertize to save money. But then we see that we don't have enough users to give us reason to advertize, so we don't advertize.

See the vicious cycle? Atari wasn't willing to spend money to make money. They wantsed US to give them reason to advertize, but to few bought systems and Atari used that as an excuse to not advertize.

2) Little Red Hen: She asked all the other barn animals to help her plant some wheat. No one helped. She asked them to help water the wheat. They didn't. She asked them to help harvest the wheat. They didn't. She asked them to help mix the dough. They didn't. Nor to bake.

But... when it came time to EAT the bread... well, I think you know how the story ends.

Jared

Hello there atarifreaks, keeping the atari hummy i see, keep the atari faith

Re: Have you played atari today

That was advertising copy for either pos (point of sale) or insertion into advrt'g print media.. I think it was promoting the vcs (now called 2600), and had a piccy of defender (me thinks)

The Only Atari ad I ever saw on telly, and I live in London (Atari capital of the universe... forget sunnyvale c.a) was the ad for the 520 st (the one where the artist is painting on canvas), I also remenmber the numerous trailers that atari were pumping out at the various UK-pcw shows of the mid 80's, like the fun is back (2600), and Atari is back, and something promoting the xegs as an advanced game system ?!!! (the one showing the cart. version of rescue of fractulas (the intro screen, presumably copied from english software's mediator.. very similar) and also GATO, spectrum hollowbyte (now part of hasbro)

There use to be lots of sources for PD and Shareware Atari ST-Falcon software in the USA.

Are there any sources left such as Atari ST User Group Librarys and the like?

If anyone knows of any sources then do e-mail me with info on how to contact them.

Also are there any large Atari ST PD/Shareware sources in the UK that would be interested in expanding to the USA in some sort of joint effort?

Do contact me by e-mail if this is of interest to you.

Thanks,
phantomm@eastky.net

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

I acutally have a number of these ads on my FTP site, along with loads
of others. I don't have the last two you mention though. Actually I
know there are quite a few I'm missing, but I've managed to amass
quite a few from the early 80s up through to the Jag.

So, they did advertize, but most of their campaigns were short-lived
and targeted to specific areas/networks. Pity, really...

1) Get an emulator. I suggest either PaCifiST, or WinSTon (or one of
its successors, known as STew)
2) Get MAKEDISK. This comes with the full distribution version of
PaCifiST, but is available separately.
3) Use MAKEDISK to read your ST disk images into a .ST image file.
4) Use these image files in one of the emulators.

The Swedish /Atarimagasinet/ has been around for 15 years now. It's a
quarterly magazine and no. 3/2000 just went out to the subscribers.

Subscription/membership fee is SEK 175 adding SEK 50 if outside
Sweden. Check http://www.sak.nu/ for details.

Jared Falvo <luposian@mailcity.com> wrote:

> 1) work on designing a new 1040ST-sized motherboard

1040ST sized motherboard with a not outdated PowerPC chip? Look here:
www.apple.com/ibook

It's the cheapest Apple could come up with on such a small footprint.
Modern small motherboard design without a van is quite expensive.
Bus speed are so high that you can't simply throw it together.

> 2) do some research in what part the motherboard would contain

The iBook still has composite out! :-) The date/time battery is so big
that you can run the entire computer up 6 hours nonstop, that's a whole
working day when you count in your lunchbreaks and such. No need for a
screen switch box as the active matrix TFT screen does color in hi-res.
Optionally it can play DVDs, and when it does, it does a full overscan
on your TV. A wireless networking card of 10Mbits/s is just $99.

It's a homecomputer/laptop/video editor/portable DVD/portable
PlayStation all in one.
And it's less than half the price of the original Atari ST 260.
If you can come up with something better than please try.

However today's OSs aren't just about multitasking your applications and
taking care of your files. It's about providing shared basics for all
applications. Like TOS provided ASCII, menu's and memory access today's
OSs provide windowing and printing for all written languages around the
world with Unicode support. Mac OS enables all hard and software to
cross reference color balance, brightness and saturation so that what
you've scanned comes out the same on your printer or at the press
facility. Every program has secure internet access to check for updates.
Every program has the opportunity to open a wide variety picture, sound
and movie files. The OS provides generic USB access to input devices,
printers, scanners, speakers, camera's. And it does the same for
iLink/FireWire. And the list goes on and on.

A modern OS doesn't just enable, say the Ethernet port it provides
capabilities of securely sharing files and printing over the network.
The printer only provides a driver, the OS takes care of getting the
files to that driver in lots of different ways. It's about providing a
basis for all programs to use.

Mac OS already does all this, yet Apple has decided to leave this OS
behind, after spending millions on upgrading Mac OS to what it is today.
And wasting another few million on a failed attempt at making it even

more modern. And you think you can simply quick fix GEM or even Mint to todays consumer expectation? Put together some hardware and making it run is not going to be enough.

Even Apple is going put their feature packed OS into an (native) emulator, yes they tried hard to revive the Mac OS, at least they got the upper part complete. Not even Linux or BeOS has got that yet, let alone anything based on the Atari legacy. With Mint and such you've got the kernel bit complete, and a windowing system. Like Linux you're still missing the most expensive stuff, the middleware. You've got NVDI to do simple font rendering, Windows includes the same, while all the big software houses bring along their own layer to allow for more typography (MS does provide lot of 3D rather than 2D middleware). With the now Beta Mac OS X Apple will provide the most advanced 2D rendering engine, any program that uses the new text object gets real time scaling PDF display and print. Mix in chinese or japanese text, bitmap and vector objects natively without writing any new code. It's like every plain text editor getting calamus for free. WYSIWYG has become very complicated with all these different objects, language and color transformations.

That's why Papyrus still flies, you stick to the essentials and make the best of it. However todays markets expects more. And Apple wants to give more, so that more programs can share the cool features, without one softwarehouse dominating a niche. (Like Adobe for publishing and MS for office). It isn't about smart programming anymore, it's about sharing and reusing code. Of course Apple is tuning their scaling algorithms for the G4's Vector/DSP units, but it is not just doing it for one program (the OS), it's doing it so that all programs can use it.

So what would an upgraded Atari based OS offer over current Windows or Mac. Or over near future Mac OS X? Even with a few million to spend you might catch up to BeOS and get an MS Office compatible suite. But that would still leave a large gap feature wise. And then you havened designed a PPC computer that outclasses and undercuts the iMac or iBook. Let alone undercuts the innards of the ever evolving PC towers in all types of sizes and prizes.

If you think that ST based apps will run great on PowerPC G3 and G4 chips than why don't you help with emulating them out of the box (in their own windows) like Classic Mac apps in Mac OS X. Or even better run them in protected memory and use Aqua (or not:-) like JAVA, Cocoa and Carbon programs. We've got an opensourced kernel so you're given all the access you need.

My point, check out Mac OS X pre-loaded machines next spring or summer. It may have taken Apple 7 years longer to get memory protection but it's got a lot of cool stuff under the hood.

Check out the iMac article for links and stuff. Flames are welcome ;-)

I don't think there ever will be a market big enough to make it pay
financially, however, it may be an idea to publish the ideas and let
people build these machines for themselves. In the 70's many people built
their computers from kits, why not today?

>Hasbro owns the key to unlock the door of which I speak. They must have

One thing you are wrong about. Hasbro DOESN'T own the GEM/TOS rights.
Hasbro only bought the name "Atari" and the copyright to a few games such
as Tempest, Frogger, Asteroids etc. They are only interested in publishing
games under the Atari label.

Digital Research owns GEM, and the TOS rights are still owned by Atari.
However Atari as a company doesn't exist, so you could say that the
Tramiels as owners of Atari still have the rights.

Cheers!

James

It doesn't have a VME port internally, no.

It's expansion port was external (well under a flap on the outside), and
it isn't a VME port.

Cheers!

a familiar design? the RISC PowerPC is a COMPLETELY different
architecture to the 680x0 CISC family of processors even though they are
all made by Motorola, so no, it isn't a familiar design.

what do u mean that using the Yamaha was kind of silly? this is called
innovation, how do u expect that Atari could produce a cheap home
computer if they used zillions of chips to do everything that a little
bit of initiative could do?

> story ends.
>
> Jared

I dont see how u can say that for a start: you dont have a plan of
action, all you do is preach at others about how we're abandoning Atari
and how your computer isn't an Atari, nor an Atari-clone but how it does
everything that Atari does. How GEM is out of date and dead and then all
of a sudden, your going to make a new OS and then how its called GEM2000
and based on GEM but for the PPC????? Yeah, you seem to contradict
yourself quite a bit. Either through the fact that you dont know what
your talking about or how your so stupid and retarded you actually are.
Another thing is that you keep going on about how your some stupid
fucking visionary as if we're re-writing the bible or something and how
we must be idiots not to listen to your preaching about some myth of a
computer that you and the rest of us are going to build, and if we dont
help you build it, we are abandoning atari and that we dont care and how
your such a poor soul and your a genius!!!!!! everyone has had the idea
of making their own computer system that's compatable with some ancient
computer, long buried by the years, for nostalgic purposes. Can I also
tell you that NO ONE CARES THAT YOU FEEL SORRY FOR
YOURSELF!!!!!!!!!!!!!!!!

regards,
Marc

Source record: 55477

As apace is needed I am forced to sell a lot of software and hardware
for PC, ATARI, JAG, ST, STE, 800XL, 2600, 7800 at silly prices. Look at
my web site :-
http://www.cyberpeeps.freeserve.co.uk
prices start at 30p.
Also Mice ï¿½5, Lexmark printer memory, NEW 4 Meg. ï¿½6. 32 Meg. EDO 72 pin.
Sims ï¿½25 UKP. all inclusive of U.K. Postage.

Hi,
I believe that the reason for a change is due to the wheel-function and that
might be the reason why a standard adapter won't work with the wheel mice -
does anyone know for sure about this?
Very strange that your Logitech doesn't work :(
Buy a new one with the option to return it with a full refund after testing.

Good luck!

Lyndon Amsdon (bindon@madasafish.com) wrote:

: Hi!

: I've had my Mouseburster for well over a year now, but the mouse
: supplied (Ice Mice) is really poor. I've never got round to getting a
: new one so a couple of days a go I bought a Pilot Mouse from Logitech.
:
: It came with a PS2 connector (6pin mini din) and a convertor for a 9
: pin type connection like the one for the Mouseburster.

Occasionally someone runs into a mouse that does not work on the serial mouse interface. This may be because the mouse draws too much power, or does not comply with the RS232 spec. The serial mouse interface does have a real RS232 interface, but the RS232 spec allows for a wide range of voltage levels and the mouse interface is at the lower end of the specification. To do it any other way would have made the device expensive and impractical.

I have never bothered keeping a list of mice that do not work since only one or two have ever been reported. However I could start one now if you wish to give me the model number of your mouse.

BTW, Jo Even Skarstein's comments on how PS/2 to serial "adapters" work are correct. It has nothing to do with speed or anything like that.

> Tramiels as owners of Atari still have the rights.
>
> Cheers!
>
> James
>

James,

You are wrong that TOS is still owned by the Tramiels. HASBRO owns TOS. Here is
a news clip:

According to the Form 8K JTS filed with the Securities and Exchange
Commission:

"On February 23, 1998, JTS Corporation (the "Company")
sold
substantially all of the assets of the Company's Atari
Division,
consisting primarily of Atari home computer games and the
intellectual property rights and license agreements
associated with
such games (the "Atari Assets"), to HIACXI, Corp.
("HIAC"), a
wholly-owned subsidiary of Hasbro Interactive, Inc., for
$5,000,000
in cash. The purchase price was determined based upon
arm's-length negotiations between the Company and HIAC.
The
Atari Assets were acquired by the Company in July1996 when
the

Company merged with Atari Corporation. There is no
material
relationship between HIAC and the Company, any of its
affiliates,
any director or officer of the Company, or any associate
of any
such director or officer."

Hasbro got all of Atari's hardware, this is obvious...

"Atari Hardware Platforms" means the following hardware
platforms: Atari 2600, 5200, 7800, Lynx hand-held and
Jaguar
game system hardware, Atari 800, ST and Falcon 030
computer
family hardware, TOS operating system, 8-bit operating
system,
and Portfolio palmtop computer.

They also have just about everything else...

"Excluded Assets" means the following assets:

These are things Hasbro does not get

Hasbro does own everything from Atari except 3 party items like GEM.

Don

You don't understand. If you want a new atari clone, that in itself isn't
completely impossible. What is impossible is thinking of it as a commercial
venture that could do anything other than lose tens of millions of dollars,
and fold without selling to anyone.

>Phoenix H603e/B603e (H=Home/B=Business); based on the Atari 1040ST and Mega

>
>Phoenix III HG4/BG4 (G4 processor; same as above)

Again, this is simply wrong. Not the powerpc chip, not the idea of a new
atari clone. But a business system? Even Apple can't really manage that one,
except in the tiniest niche enviroments. If there could even be a third, it
would be the old amiga (not this Digital Enviroment crap) and the newtek
video toaster systems. That was miniscule years ago, and now it can't even
register as a blip on business IT purchasing radar. If you want people to
buy these, target the hobbyists. Target the atari enthusiasts. Target people
who can help build it, but can't build it all by themselves (like me).

>With a year or two between these systems, and a trade-in (old to
>new)/trade-up (home to business model) program for the users, with
>encouragement to communicate on a world-wide level... it would be something

>of an Atari that no one has ever seen before.

Haha. Is this a Save the Atari Foundation charity? Businesses rarely buy back equipment, and if so only because some peculiarity of the market means customers want to get rid of them, and they have a kickass resale value. This is not one of those peculiarities.

>And sadly... probably never will.

This takes some figuring out, I will grant you. You or me, we have something that is of zero value to us, and we are likely to give it away to the first person who acts like they would enjoy the item in question. Even stranger in that they could license it or give it away, and still actually own them. This has more to do with rape and pillage corporate business tactics in general, than it does with the atari. Maybe if you like, you can email me, and I'll explain some of their "mindset", if the implication that a corporation has a mind isn't too obscene.

>Sure, we're all concerned about failure, so we let the other guy do the

This isn't exactly fair. It's not totally unjustified either. If the bread is some sort of "new atari hardware business" and its ensuing profits, well then you are just a fool, no more needs to be said. If the bread is getting to see the atari platform live out a full life, well then no matter how much others eat all your bread, there will still be enough left over for you. In any event, wishing for more than 4 or 5 capable and willing to help was just unrealistic. Most here might know oodles about the atari platform, some might even be kickass coders... but how many are electrical engineers capable of designing or helping to design a PPC based motherboard, complete with all the requisite peripheals? Hell, I have trouble figuring out how to

use statecad for xilinx cpld's. Do you even know what a cpld is? Instead, ask all here 'what a new atari clone would HAVE to be'. There will be cranks, who post obnoxious answers. No fixing that. But don't tell us right up front, that not only will there be agp and pci, but they'll be soldered to the main board. Ask us if we really want PCI on the thing, or if we do, should we also put a legacy vme slot on the thing? Ask how much software/OS compatibility is the least we'll accept, and what performance gains you have to give in return. Ask if there will be those willing to put together their own board, or even wether they'll buy a kit at all, with the intention of paying someone else to assemble it (don't even dream of automated assembly *see note below). Ask us what kind of case the thing should be made for. Ask questions first. It is just possible that 18 months from now, you and 50 others could be posting to this forum from the NeotariPPC that you soldered by hand. But only if you show a little sense and patience.

*Note: We're already talking multi-layer pcb board for the motherboard. Where as simple boards have copper traces on both sides, with multilayer they take anywhere from 4-24 single sided boards, and expoy them together, for ultra-dense super complex designs. We might get by with 6, I think 4 is too much to hope for. A 6 layer 9x12" board is costly. At www.4pcb.com (not the best, I'm still looking for a fab that I like for a much smaller scale project of my own) quantity 2 prototype boards with 5 day turn around is $493.50. 4 week production, the price is as follows... qty 20 $133.31 qty 50 $98.25 qty 100 $86.56. This is for an unpopulated board, no chips on it at all. The main board is going to cost no less than $400 each, and that only if you can sell/group purchase more than 20 at a time. Automated assembly will cost you the price of two solder paste stencils, at anywhere from $150-250 apiece. Spread among 50 people, not too bad. But that's also 2 runs through the line. It would take longer to program and load the machines than it would to build them. These machines cost assembly plants something like $1400 every hour they are down (and I don't think this is exaggerated too much). All in all, for such a small run, not only money up front, but probably would add $350+ per board to the cost. Only if you were doing a run of 1000 or more, or had a contract with the assembly plant for several runs of 100 every few months would it get anywhere near being feasible. Verdict: If this can't be hand soldered/assembled, it won't ever happen. Still trying to figure out how you'd do prototype, it's way too complex to breadboard, and even if I could manage 10mil traces on my own homebrew pcb's, I'd only be able to do 2 layer for you, which just won't do. Can you convince everyone here to chip in for prototype pcb's, assuming that you come up with a viable design? (this totally ignores that for a project of this size that you could ever get a working #1 revision board).

Hope I've been informative, or at least not too much of a dream murderer,
John

Hello,

The TransAction website has been redesigned by Paul Caillet.

There is no more PHP on the main pages: this will allow the site to work
even if there is a problem on the PHP server of Free.fr.

You can also visit the old good InterActive pages from the site.

There is also a mirror site on LybertySurf, just in case...

TransAction: http://atari.transaction.free.fr
mirror : http://perso.libertysurf.fr/transaction

Bye,
/Pascal/

I thought the parallel port was run by the MFC. I didn't think there were
enough lines on the YM2149 for that. I think it runs the joystick ports on the
MSX.

>The Atari 1040ST, though it was hampered from the beginning, was an

Oh, do you /really/ intend to include networking? How grand.
Networking is a standard accessory in every system produced today, whether
used for home or business purposes. Cable internet is becoming even more
widespread, and the lads like to connect their computers in order to play
Quake or copy pornography. Ethernet is a simple, cheap expansion, and should
be built into every machine.

>Phoenix II HG3/BG3 (G3 processor; more and faster of everything for both

My neighbor just got 060/604e card for his amiga, and it
cost over a grand after taxes. It's just an expansion
card with the 2 cpu's and enough electronics to make it
all work, and 4 simm slots for old 72-pin simms.
This card effectively costs more than an faster iMAC.

No sound, no video, no case, no keyboard, no drives,
so how in the world do you expect to build this miracle
Atari for less and fill in the software gaps?

4811. Mega STE Internal HD Questions

Newsgroup: comp.sys.atari.st
Date: 2000-10-29 03:10:15 UTC
From: taj16@dreamscape.com
Message-ID: <svn58nikt8ho1a@corp.supernews.com>
Source record: 55492

I just received a Mega STE that I intend to use to replace my now comatose Mega ST4. This MegaE has been idle for some time, and the internal hard drive was removed a while back. When the previous owner was checking it out before shipping it, he couldn't get the internal HD port to work. Fortunately, the external DMA port works fine, so I can use it with my present drives.

I'd like to put in an internal drive. Can anybody give me the specs I need to make a proper selection? I use ICD HD software, the Link version of ICDBOOT 6.5.5 and associated programs, if that makes any difference. Also, after he had shipped the MegaE, the previous owner remembered something about a jumper on the motherboard that enabled/disabled the internal HD. Does anybody know if this is true, and if so, where I can find it?

Source record: 55495

Gee, seems as though, no matter what peope say and I say, I just can't give it up, can I? *sigh*

Anyways, some (purely hypothetical) questions:

1) *IF* such a computer, with the specs I list below, were to be released... by Atari, mind you.... would you buy one, provided that you could run (at least) old ST software on it?

a) 1040ST and/or Mega ST case
b) PowerPC 603e CPU
b) 32-64Mb of SDRAM
c) ATI accelerated 3D video chipset
d) Yamaha XG audio chipset

2) If that unit came in two models; the 1040ST-styled model being a little less powerful than the Mega ST model, which would you buy?

a) Home
b) Business

3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for the Mega ST model? If not, what would you be willing to pay for either?

3) If Atari, as a computer manufacturer, returned, would you be excited and tell others?

Please, no smart-ass remarks or non-serious replies. I am planning on compiling the number of users (no names or anything, just the numbers) that reply positively to this post and I'll post this message to other Atari newsgroups and elsewhere to see just how many people are out there that *would* be willing to buy such a system. No need to repeat reply if you visit more than one newsgroup this message is at.

If you know people that might be interested, show them this message and let me know if they are. I'll add their numbers to the list. I want to see just how worthwhile my idea is to the general Atarian/non-Atarian Internet public.

Thank you for your time...

Jared

|office).

Perhaps there is a difference in philosophy here. I can't say why everyone else sticks to Atari but I do because it is simple, clean and fast. I don't want multitasking, I don't want colour, I want an excellent word processor, large monochrome monitor and high resolution black and white laser. I have all that with my Hades, Eizo etc.

Now, the question that I ask myself now and again is, if people really understood what they want, would they go for multimedia, multitasking, all singing, all dancing operating systems? Some would, of course, but I suspect many, in business perhaps, would not. In other words, is it really the markets that expect more or is it the producers always push, push, pushing to keep ahead of their competitors, egged on by the computer journals which dwell on size and speed and not on "quality."

I paid well over 1000 UK pounds for my Hades by the time everything
was added. If you can produce a computer that is significantly
faster than the Hades, with up to 128 MB memory, 1280x1024x2 video
resolution, 3-4 GB hard drive, fast startup, stable, entirely
compatible with my Atari programs, then I would buy one for say 1500
UK pounds. I would be quite happy for it to fit into a pc case and
use a pc keyboard etc.

|3) If Atari, as a computer manufacturer, returned, would you be excited and

Just as well this is hypothetical because you can't bring back the
dead. No, another company of the same name would not excite me in
the least.

I would only buy a computer if it had more bang for the pound (me being
british) and was more a remake of the ATW800 than the ST.
The fact that your computer is to be based on the elderly 603e PPC cpu
and only has 32 to 64MB of RAM would count against it for me. By the
time that you've created this computer, it'll have to be customised so
much to run Atari software and be compatable with Atari that it will
cost a fortune and i'd probably be better of buying a dual-celeron with
128MB ram and would run atari software faster than the 603e if i used an
emulator. I dont like the way u want to re-use the old atari cases. To
be honest, I find the ST keyboard very awkward to use. I dont think this
hobby computer would make it to a business level, because applications
are already available to the PC and Mac which can be bought for less
than the price of your computer including the software. To be taken
seriously, you'd need to offer something that the PC and Mac dont offer.
To be honest, I think you'd be better (and more economical) if you
developed an ST-card for the PCI bus so Atari fanatics can keep their
computers that they spent loads on and run Atari software with 100%
compatability. Then people would have two computers in one. The ST-card
could use the PC's CPU and RAM for rendering and so on like a
super-charged-DSP. This would make your project more reasonable and
realistic than some computer that is never going to be taken seriously
especially how the PC has a massive reputation and Mac as well. Take a
look at Acorn, they dared to be different and now they dont exist!

Tell me, oh Lord, if the platform is determined by the hardware, does that mean that my Cyrix PC is a different platform from my IBM thinkpad because one uses an Intel cpu and the other uses a Cyrix cpu or even my friend who has an AMD? They all run Linux and the cpus are all 80x86 compatable, so they can all use the same programs with the same codebase.... but they are really a different platform? I suppose laptops with the mobile Pentium III and desktops with the Pentium III are different to because the mobile Pentium III is different from the desktop variety? Please help me, Oh Lord, as I am confused!

Well it's not like you know SO MUCH, is it? you dont even know who owns
the rights to GEM, or that the only thing PPC and 680x0 has in common is
that they're made by Motorola and even that isnt completely accurate.
IBM and Apple are also somewhat involved in the PPC and that PPC is a
RISC cpu and completely incompatable with 680x0's CISC architecture.
Your going on about how your gonna build some stupid fucking ST that is,
oh, so powerful yet you cant even find bits on the ST. how do u know
that the pins are defineately there? is this guy that's selling the ST
gonna let YOU take a screwdriver to it?
do you have a sleep deprivation problem or are you just an attention

seeking prick who feels sorry for himself? what's with all the
sigh-ing

I have a CBX D3 digital recording processor and I use the CBX D5 application
or program
The application doesn't recognise the CBX D3. Do I need a System Downloader
Program
if I am using a CBX D5 application?and where do I get one since these are no
more to be
found in the shops? Any suggestions will be welcomed.

Thanks
Wagaz

4832. Re: Mega STE Internal HD Questions

Newsgroup: comp.sys.atari.st

From: Steve Sweet <stevesweet@bun.com>
Message-ID: <972926032-938647AEicMi@bun.com>
Source record: 55441

Hi Thomas

>I'd like to put in an internal drive. Can anybody give me the specs I need
>to make a proper selection?

Its gotta be SCSI, and if youre using normal TOS you need to pick a drive whereby using 512meg partitions doesnt leave space redundant. Ive got a pair of 4.5Gig in mine but i'm using Magic and can have 1Gig partitions.

>I use ICD HD software, the Link version of ICDBOOT 6.5.5 and associated programs, if
>that makes any difference.

Thats good enough.

>Also, after he had shipped the MegaE, the previous owner remembered something
>about a jumper on the motherboard that enabled/disabled the internal HD.
>Does anybody know if this is true, and if so, where I can find it?

I dont think there is such a link. However, if youve still got the Atari adaptor you need to make sure that the DIP switches are set to match the ID of the internal drive, ideally ID 0 so that the Mega will boot from it. If you havent got the adaptor then you'l need to find one in order to be able to use intenal drives.

Where in the world are you?, if youre local i could help.
.

HELLO,

> How about the DESKICON.* files?

If you are using IE or Netscape do and click the 'Software' folder of the
top page.
Click ' Software window' in' DESKICON. RSC' that is in page' Software' .

' http://www.hctnet.ne.jp/sb/jtake/software/iconrsc.zip ' if it is the
browser other than it and input.

I doubt that the PC would ever die off as there isn't one two or just a
few companies making PCs and IBM's move to use 'off-the-shelf'
components has made the PC so easy to design and manufacture that it
will just keep going and also, i know how much microsoft sucks, but
Office and so on are what's usually used in businesses and so on. the
fact that there are loads of PC manufacturers means there is more
competition and the prices fall right down while Macs are a closed
technology that is really expensive compared to an equivelant PC also
the PC has a bigger software base than any other.

That doasnï¿½t work. You need an "Atari" mouse.
PC mouses had mostly an serial port.

PC mouses need an specialy interface like "YUMI" or some else.
(Try web page from elmar hilgart / germany)

Amiga mouses can be connected to an atar by changing connector pinout.
Older PC "Bus-Mouse" can by modified for an Atari Computer.

DOITST archieve contain them all.

Easy way is to take an cheap original mouse from somewhere.
(Out of the web)

A clone, in other words, but using a PPC. So a clone *and* an emulator. Easier to use MagiCMac or MagiC-PC, similar compatibility level. If you really want to do a clone, try listening to Jo Even Skarstein, who has made some of the more sensible remarks on this. Apologies to the rest of you who've also been trying to talk some sense in this mess of a debate, Jo Even sprang to mind first.

> 2) If that unit came in two models; the 1040ST-styled model being a
little
> less powerful than the Mega ST model, which would you buy?
>
> a) Home
> b) Business

Neither. MagiCMac/MagiC-PC would do the same thing for less and give access to loads of other software etc. Why waste money on something which offers less?

> 3) Would you be willing to pay $1,000 for the 1040ST-style and/or
$2,000 for
> the Mega ST model? If not, what would you be willing to pay for
either?

No. I'd pay no more than the cost of MagicMac/MagiC-PC, but with the latter I get lots more for my money and it's all in the same box as the existing PC/Mac. Milan's pricing was much more sensible (IIRC), but even so they couldn't sell huge volumes.

> 3) If Atari, as a computer manufacturer, returned, would you be
excited and
> tell others?

I couldn't give tuppence about Atari as a manufacturer. They were the ones who screwed up marketing some really excellent computers (exception: Atari Deutschland) and then cut and ran leaving the platform orphaned. A resurrected Atari is something purely for nostalgia freaks.

> Please, no smart-ass remarks or non-serious replies.

This is a serious reply, believe me. I've kept out of this debate up to now, but I've now said all I need to say on the matter.

No. FPM and EDO are opposites. Parity is just additional bits (33 or 36
instead of 32) and can be with a FPM or EDO SIMM.

>The problem on the SIMM becomes a problem for the user.

If the SIMMs are broken, bring them back to your dealer.

>so how in the world do you expect to build this miracle
>Atari for less and fill in the software gaps?

Dude, I'm impressed. I will answer this question, if you care to here. I want such a card for my amiga, but I'd never be able to afford it, and even if I could, I still would be reluctant. The third party developers have been raping the community for years, that's why it cost so much. Even counting the hard to get/expensive 68k chip they need for that board, it wouldn't cost more than $300 for materials, and that's in tiny less than 50 quantities. Any more than 50, and they really rake in profits. THe new amiga accelerators that simply emulate a 68k probably cost no more than $150 materials.

If I thought I could manage such a beast myself, I'd gladly build my own. But I'm just getting into hardware hacking, I might be able to do my own IDE cards and such, but a PPC is just too big a beast to tame for me now. And that's the hardware side of things, no way I could do the code for it.

Now, as a business Jared is dumb if he thinks he can offer neotaris for that price. But the cost of parts could easily be under that amount.

My opinions follow.

>1) *IF* such a computer, with the specs I list below, were to be
released...
>by Atari, mind you.... would you buy one, provided that you could run (at
>least) old ST software on it?

Dude, the Atari name isn't what people love. It's the atari computer.... if it had a different name slapped on it, they'd still love it. Me, I might be involved with it, and buy one, but I don't think I can justify the cost. Still, if I were involved, and payed the 1000-2000 in small increments, as we put it together... Also, not concerned with running 100% of the legacy hardware. If we can even manage 75%, I think we could call that a great success.

>a) 1040ST and/or Mega ST case

I can understand not wanting to just slap it in some generic PC case. But I don't want to butcher what I consider a great computer... I collect these old things, and if I thought someone was scrapping it for the case, then the guts damn well better be dead or I'd be pissed.

>b) PowerPC 603e CPU

You seemed to have latched onto this chip because I mentioned it and the price. We might do better to design for a G3 or higher... by the time we finish it anyway, it might be at the price the 603e is now. We could borrow CPUs from macs for the prototype, so this might not be a prob. (They do socket these in the newer macs, don't they?)

>b) 32-64Mb of SDRAM

Dude, a 72pin or even DIMM socket costs like $1.35. So the only real cost is that of the added complexity for addressing more ram. We could socket it to accept up to 128 no prob, I would think.

>c) ATI accelerated 3D video chipset

Let's worry about just getting hi-res true color svga. Dreaming about using a PPC is one thing, dreaming about the Radeon or Geforce is almost retarded. We'd never ever get samples, they're not socketed, so we can't even salvage (any volunteers for loaning your $300 card so we can prototype? haha). They only sell in qty 5000+ I'd bet. This is simply off limits.

>d) Yamaha XG audio chipset

I don't know as much about sound chipsets as I would like. But this seems as likely as any other.

>2) If that unit came in two models; the 1040ST-styled model being a little
>less powerful than the Mega ST model, which would you buy?

Let's not spread effort too thin.

>a) Home

Even home use is a little much too ask for. Atari zealots and other fringe
lunatics should be the target "market".

>b) Business

Dude, even the last few big mac shops are closing down. IT dept's don't like
having to support both mac and pc, and there is no such thing as a 100% mac
shop. This has to be included as some sort of joke I don't get.

>3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000
for
>the Mega ST model? If not, what would you be willing to pay for either?

I don't think those kind of prices would deter the people who actually want
such a thing.

>3) If Atari, as a computer manufacturer, returned, would you be excited and
>tell others?

Actually, this would most likely be a Bad Thing (TM). This happened with
amiga, and I am thoroughly pissed.

I will bet you the number is higher than you think. I know of a number of
Atari users in my area. My Atari club has about 15 members, but there are
alot more than that who have and still users their ST's.

OOOH. The incredibly huge, almost infinite market full of salivating millionaires that would trade their first born children for yet another atari clone. My god, why do I even bother to go to work, this is better thanplaying the lottery.

I'm not Jared, I think I actually have a clue about how hardware is designed and built. Besides, ask me in a week, and I will actually be able to claim/prove that I have had some success in doing such things, albeit on a much smaller scale (ethernet card for an Apple2). Even if I think that a PPC atari clone could be done by a bunch of hobbyists with common interest, I don't harbor any delusions of it being or becoming a viable business. I just hate having hardware manufacturers that are all a bunch of worthless corner-cutting, greedmeisters who often are unwilling to support even the more popular 2nd tier platforms. I don't believe that people really have to rely on them as the only source of hardware, but if no one recognizes this, it is as good as true.

Have no fear!

Platform == OS.

The nice thing of a platform is, that you can not see what is underneath.
As long as you stay on top of it of course.

Hope this releaves you. :-)

>you who've also been trying to talk some sense in this mess of a debate,
>Jo Even sprang to mind first.

Ah. So both Dell and Compaq make atari clones, they just don't know it.
Cool. That you don't have a clue what emulation is about is remarkable, but
hardly helpful to the rest of us. Nearly every computer in the last 15 years
has emulated one thing or another at a low level in the hardware... we don't
call them "emulators". That term is usually reserved for MAME or UAE. No
idea what is so wrong about a clone, either. Funny, but at this point, we
don't even use the term "clone" at all anymore when describing pc's... and
no one bothers to distinguish between the 'real' IBMs and those fake Dells.
Maybe, when the original maker of the platform screws things so seriously,
people should be willing to just disown them, so to speak.

>Neither. MagiCMac/MagiC-PC would do the same thing for less and give
>access to loads of other software etc. Why waste money on something
>which offers less?

In other words, you are more than happy to see only one type of computer,
one platform, the world over. You're not saying, "sorry count me out",
you're saying "others shouldn't WASTE their money on anything but a pc".
Think about it for a moment. Even if I wouldn't/couldn't get one myself, I'd
be happy to see a new PPC atari clone built.

Hi Iggy,

>I vehemently agree that there should have been a TCP/IP standard defined
>many years ago, but ASH releasing their own stack years after the others is
>just inherent stupidity, and a Microsoft-like sense of business.
Where do you get the silly idea that IConnect was released years after the
other stacks?
-MinTNet
-STIK
-IConnect
-STiNG
-Wensuite
-Draconis
Note that the above mentioned stacks are placed in order of being released.

MinTNet just like IConnect doesn't run under TOS, they both do need their
own appropriate OS and clients. Way back in 1995 for someone using TOS or
MagiC there was only STIK to consider. STIK couldn't handle PAP, and was
limited to the SLIP protocol which at that time was being replaced by a lot
of ISP for PAP.
IConnect made PAP possible for MagiC users, it's always been very reliable
and easy to setup... the same can be said of the clients. You'll probably
disagree but there's not a lot out there that can standup to ASH Emailer,
Teli, Chatter and Fiffi.
The IConnect clients are reliable, relatively bugfree and do the job. What
more can one ask? they all share the same look & feel, handle the modern
protocols (AV, D&D, GemScript etc...). The only client missing is ICQ, but
that could very well be in the pipeline...

>yet is incompatible with every one of them,
Why should it be compatible with stacks that appeared later?
As an IConnect user I don't really care if it's compatible or not with other
stacks, I like the clients, they work for me and I don't have to cry out for
help unlike some people here everytime there's a new version of the "free"
stack released. The clients belong among the best available on our platform,
apart from Okami IMO there's nothing that comes even close... Someone using
IConnect & clients doesn't really need to look further.

I'm not really interested in the stack used, it's the clients which are
important to me, if you're content with newsreaders that constantly loose
threads& postings, buggy mailers etc... go ahead.
Instead of blaming ASH of using Microsoft tactics why don't you just admit
that you don't like MagiC and commercial software? This is an attitude that

not only you but a lot of people here share. Well, things are looking good,
the way things are going right now commercial software will be complety gone
in a couple of years... if you really think that the freeware and shareware
market is going to fullfill all your dreams then you really need your head
examined....

Oh... for the record, the difference between ASH and Microsoft is that ASH
has always tried to release and publish quality software, while Microsoft
specialises in releasing shit...
ASH doesn't only stand for MagiC, wonderfull programs like Texel, Artworx,
Phoenix, Papillon, Signum, RSM, Jinnee...etc carry their logo as well.

Cheers from Belgium

>I would be glad if something like this (minimal TOS implementation) existed
>on Atari, too- for machines like ST and MegaST which have limited memory and
>low CPU speed. On my MegaST I usually use TOS 2.06 loaded into RAM.
MagiC can be burned in ROM, no need for TOS anymore. If you still want to
keep on using TOS for certain tasks then ROM's containing TOS and MagiC are
possible as well, all thats's needed is a simple TOS switcher.
This topic has been argued here many times before but for some reason is
never been taken seriously. MagiC is a full blown OS not needing TOS in any
way, MiNT depends heavily on TOS, and MagiC in ROM will free up an additional
256KB as well...

Cheers from Belgium

I do hope there is alot of Atari users left in the USA. It's hard to tell
as I don't see alot of postings in here from US folks.
Also there are no Atari user groups in my area. I've been more in touch with
Atari folks outside the US since getting on the Net.

Anyone know if Current Notes or any other Paper/Disk based Atari Magazines
are still being published here in the US? I really miss those good Magazines.

Also, I would like to join a few good Atari User Groups that produce their
own Paper/Disk News letter. Maybe someone can point out a few good ones my
way?

I use to get the SALSA newsletter from Texas, but don't know if they shut
down or not.

Also would like to know some of the best Atari BBS's left in the USA.
Would appreciate any phone numbers thru e-mail.

And I have noticed that alot of the Good Atari FTP sites have either shut down
or changed their address and not let me know about 'em :)

Any of those that someone could pass their addresses to me thru e-mail would
be much appreciated.

>with CAB 2.7. Grrrrr.) Audiogalaxy seems to work okay, though.

Mind you, there is a GNUster as well as numerous other free Napster
implementations. Doesn't seem like such a difficult protocol to reverse-
engineer (well, with open source GNU software, even this isn't necessary).

4875. Large Hard Drives on Ataris

Newsgroup: comp.sys.atari.st
Date: 2000-10-30 01:42:15 UTC
From: phantomm@eastky.net
Message-ID: <8tijln$39v$4@nd.eastky.net>
Source record: 55397

Got a question regarding Hard Drives on Ataris.

If I were to buy a SCSI or IDE hard drive that is around 20 Gigs, could
I use it without problems on most any Atari ST-Falcon?

Since there is a limit to the size of a partition, 1 Gig on the Falcon and
using TOS or Geneva you can only go up to Drive P. Would having extra unused
space on the SCSI or IDE hard drive cause any problems?

phantomm@eastky.net

4876. Latest and Best Atari DTP software

Newsgroup: comp.sys.atari.st
Date: 2000-10-30 01:52:34 UTC
From: phantomm@eastky.net
Message-ID: <8tik92$39v$5@nd.eastky.net>
Source record: 55398

Been using PageStream for most all my DTP needs and have been most satisfied.

However with the CT2B Falcons extra graphics capability 800x608 in TC mode,
I'd like to get the best DTP software that will allow alot of nice 256 color
or better pictures to be displayed on the screen when creating a page layout.

What are the best and latest DTP packages available that allow lots of colors
on screen and work well with the Centurbo II?

I also have a nice fairly stock Falcon if for some reason the CT2B doesn't
like the DTP software.

And are there any new Word Processing packages that have support for nice
Color pictures?

Any URL's for Demos or etc would be helpful.

Future thanks for any advise,
phantomm@eastky.net

>1) *IF* such a computer, with the specs I list below, were to be released...
>by Atari, mind you.... would you buy one, provided that you could run (at
>least) old ST software on it?

Given the right price.

>a) 1040ST and/or Mega ST case

I'm not particularly fond of either. Cute, but hardly useful. OTOH, I wouldn't
mind something smart like the TT case, since I find a full-blown ATX case too
large for my room.

>b) PowerPC 603e CPU

Low-powered, but quick even with 68k emulation, given the emulation is limited
to the most vital components.

>b) 32-64Mb of SDRAM

Great.

>c) ATI accelerated 3D video chipset

I'd rather choose my own. Of course, that requires slots.

>d) Yamaha XG audio chipset

Isn't the Yamaha XG just a MIDI synthesiser?

>2) If that unit came in two models; the 1040ST-styled model being a little
>less powerful than the Mega ST model, which would you buy?

Depends on price and expandiblity.

>3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for
>the Mega ST model? If not, what would you be willing to pay for either?

No. In that case, I could buy myself a Milan or Hades, and probably end up
saving some money, too. Perhaps with a lower dollar.

>3) If Atari, as a computer manufacturer, returned, would you be excited and
>tell others?

Depending on what they were building.

4878. Falcons internal connectors

Newsgroup: comp.sys.atari.st
Date: 2000-10-30 02:02:18 UTC
From: phantomm@eastky.net
Message-ID: <8tikra$39v$6@nd.eastky.net>
Source record: 55410

I read a posting that the Falcon internal connector for 3rd party hardware cards is a VME port.

Is this true?

If so, isn't the internal port in the MSTE and TT a VME port as well?

If so, and the Falcons is a VME, are they Pin compatible if the Falcon had the same kind of connector for cards like the MSTE and TT does?

Also would it be possible to convert the Falcon internal port using ribbon cables and connectors to accept PC cards such as ISA or PCI?

From: phantomm@eastky.net
Message-ID: <8til4v$39v$7@nd.eastky.net>
Source record: 55409

I remember years ago that someone told me that ST users were using
Atari 8-bit 850 interfaces on their STs.
Now I don't know if this was true or not, it was years ago.

Does anyone remember anything like that and for what purpose?

The 850's do have alot of serial ports and the like on them.

4881. Now for something... "exciting and new".

Newsgroup: comp.sys.atari.st
Date: 2000-10-30 02:26:17 UTC
From: Jared Falvo <luposian@mailcity.com>
Message-ID: <a%4L5.383$z93.55779@news.goodnet.com>
Source record: 55404

You know, I had a relatively brilliant idea hit me today (provided it hasn't already been thought of or done). Instead of emulating ST hardware, why not make a PCI card that has the ST right on it! Not just the ROMs and/or one or two parts, but 95-100% of the ST's hardware on it!

If you look at an 1040ST, there's a LOT of wasted space. Especially considering today's technology and design. You can get circuit board traces down to a fraction of what they were in the old ST. And resistors/capacitors? They're microscopic surface mount devices now. Substitute the 2 or 6 ROMs for one ROM (or a tiny, surface mount Flash ROM, like PC's use today. For the RAM, use SDRAM chips, which are much higher density and surface mount also.

For the rest of the ST parts, take them out of old ST's! Unsolder 'em all! That CPU, GLUE, MMU, and stuff. Put them on the new PCI board. If I don't miss my guess, I would say the reduction of some part numbers/sizes and trace width should reduce the overal board size to a board you could put in a PCI slot.

In order that you could run this "ST card" on a PC or PowerPC motherboard, using a standard video card, you would probably be best to emulate the video shifter, so that you can run the ST in a window on your main OS. If you kept the real video shifter, you'd probably run into problems trying to get it to work with an SVGA monitor.

Now, since the "ST card" doesn't have any ports on it, you need to write software that translates or redirects the functions of the ST (like the sound chip for the printer port) to the apropriate hardware. You might even emulate the floppy chip in order to use load/save files to and from your main hard drive or floppy drive, etc. You would create an ST Environmental Partition file (STEP) on your main HD, that the ST card used, thinking it was a MegaFile30 or whatever. Of course, you have to have a program that gives you access to the ST Card in the first place.

Now, assuming any of these is reasonable or feasible or worth pursuing at all, we port GEM or MiNT or whatever ST-derivitive OS to PowerPC (if we want to go that route) or Intel Pentium. In the case of Intel, we wouldn't have to port GEM at all... it's already there on that platform. We'd just continue to improve upon it until we felt it was worth calling "GEM2000" (or GEMillenium or whatever).

The ST would run at full speed. The hardware would satisfy *all* software, because it was genuine, not emulated. You could even run those copy protected games on diskette (assuming you have any)!

Then, we take the opportunity to use the ST Card to port as many existing apps as possible to the new GEM on the chosen processor. We have the best of both worlds!

We save money on parts, because we use existing parts from old STs. I was lucky to find a 1040ST for $5.00 at a thrift shop. The only question is... how much would it cost to produce the PCI PCBs and transfer the existing parts to them.

Any ideas if what I have just suggested is pure silliness or not? Seems at least a little more reasonable than my previous ideas... hmm?

Well, unfortunately, these days we don't have a whole heck of a lot of choice who to trust, and they seem to me to be one of the few still actively pursuing high-powered hardware upgrade devices, even if slow in coming. Maybe if we DO support them, they'll be able to get business done. I'm honestly surprised more Atari dealers aren't in the same situation. I personally am hoping that they'll be able to get the Tempest card released, so I can do more with my Falcon.

Hi,

I have a Milan040 available if anyone is interested.
Milan040 For Sale (USA)

If interested please E-mail me or call me at fmh@netzero.net or
440-286-2567
I'm asking $1,000 shipped anywhere in the continental USA via UPS
ground.

Hi,

I went through hell to get this and now that I finally have it I
hardly use it.
The high price I paid does not justify it collecting dust so I've
decided to sell it.
The unit is in mint shape.

68040-25mhz CPU
32 Meg RAM
4.3 Gig IDE Hard Drive
S3 Trio V64 PCI graphics card with 2 Meg VRAM
German Keyboard
Mouse
10/100 PCI Ethernet Card
Cased in a US Mini Tower AT case with 110/220 switchable Power Supply

Comes with all manuals, CD-ROM, and Floppies.
Bundled software consists of:
Texel Home (Spreadsheet)
Draconis (Internet Suite, browser, E-mail, Telenet)
Papyrus Home (Word Processor)
and more.

Operating System(s) are TOS 4.08 (English) and MINT / N.AES (German).
Hard Drive contains a clean install so there is no clutter.

For more info on this beast goto the following URL:
http://www.milan-computer.de/gb/products/milan01.html

This isn't unheard of. Apple made an "Apple IIe card" for the mac (I have one), that fits in a slot and is a complete apple2 on a board. Apple also made various 286/386/486 pc cards for the mac. Amiga also had various boards, though I believe their "mac" board didn't have its own cpu.

There is space on a standard ISA card slot for at least 3 plugs. No idea which would be the most important, since we'd lose the keyboard and video plugs. Not an atari expert.

I don't really like this idea. It's been popular before, for various other computers, but I think that if you really want the computer, you shouldn't take half measures. Guess that's why I collect them, instead of playing around with emulators.

It's your own ST you'd be butchering. Philosophically though, I think it's akin to destroying a cultural artifact. I mean, maybe it isn't such a big deal with atar's... but if someone suggested scrapping a bebox for something, even if it's their own property, this would be a tragedy (only 1800 or so were made, perhaps even a few have already been destroye).

>Any ideas if what I have just suggested is pure silliness or not? Seems at
>least a little more reasonable than my previous ideas... hmm?

Not silly, there is more than enough precedent for it. Still difficult, not sure what it would offer over buying a $5 thrift store ST.

>found there.

What I had meant, was that there were no corporations or other large entities (universities/schools, goverment agencies) that were 100% mac. Apple has dabbled in servers before, but never committed to them. And when its split mac/something else, not only do they eventually decide to axe the mac, the "something else" almost always means windows PCs. Over the next 2 months, my current job will be replacing macintoshes with windows workstations. Somewhere around 10,000 macs nationwide will be wholesaled out when we are through. I was suprised myself, that an organization of this size used macs to such an extent. At one time, it was something like 80% mac,15% windows, 5% unix. Guess which one they decided to get rid of though.

Also, shame I don't live in Arizona. Only thing around here is CompUSA.

John

Perhaps you should do your homework first...

1) MiNT does not depend "heavily" on TOS, as stated above it only needs a very few (X)BIOS-functions present. Implementing these in the kernel just to be self-contained doesn't make sense, it's just a waste of time. They are instead replaced with proper device-drivers.

2) MagiC is self-contained only on some platforms, MagiC Milan, MagiC-Mac and MagiC-PC needs another OS in the background. E.g. MagiC Milan is more dependent on TOS than MiNT. You might ask yourself why MagiC has drifted away from a self-contained OS towards a layer above TOS...

Anyway, the topic of this discussion was porting an existing TOS-compatible OS to another platform, MagiC is hardly relevant here.

I'm not quite sure about the order of IConnect and STiNG, but otherwise this is definitely correct.

> MinTNet just like IConnect doesn't run under TOS, they both do need their
> own appropriate OS and clients. Way back in 1995 for someone using

What I don't understand is why IConnect wasn't made MiNT-Net compatible. There's nothing in MagiC that prevents this, and implementing it as a device doesn't imply CLI-tools either. In fact, they could have made it binary compatible with MiNT-Net and still kept the exact same GUI. True, applications that use socklib require a couple of text-files present in u:\etc, but these could have been put in the ramdisk and handled by IConnect itself, completely transparent to the user.

Instead, an approach similar to STiK was chosen, but without compatibility to the (then) most popular stack. Probably a good business strategy, but annoying for the users.

True, having MiNT-Net or STiK-compatibility could have affected their sales of MagiC, but they could easily have solved that with their usual "if (!get_cookie("MagX"))"-approach...

Btw. these arguments applies equally well to Wensuite and Draconis, so please Dennis - don't read this as "yet another ASH-bashing message".

> MagiC there was only STIK to consider. STIK couldn't handle PAP, and was
> limited to the SLIP protocol which at that time was being replaced by a lot
> of ISP for PAP.

Make that PPP.

> IConnect made PAP possible for MagiC users, it's always been very

There are two really major drawbacks with IConnect:

1) It only works with one point-to-point serial link, and only with a modem. This means to LAN-possibilites, i.e. no way to use cable or ADSL which is becoming popular now.

2) The API is a well-kept secret, so it's not possible to write an emulation-layer for any other stack if you want. Unless you enjoy debuggers and monitors then.

If (2) was taken care of, IConnect would be a lot more interesting since you can either write IConnect-layers for e.g. STiNG or MiNT-Net (like GlueSTiK or the Draconis layer for MiNT-Net or the Draconis-module for STiNG) or a working STiK-layer (or even MiNT-Net) for IConnect.

> and easy to setup... the same can be said of the clients. You'll

[snip]

I won't argue about the quality of the clients, this is definitely a matter of taste.

Now that's freedom for you ;-) But if that's the way you like it... I would prefer to be able to use *all* available internet software, regardless of who makes it.

> in a couple of years... if you really think that the freeware and shareware
> market is going to fullfill all your dreams then you really need your head
> examined....

Let me see, what commercial software do I use right now... Hmm... OK, N.AES is commercial, but I'm more and more impressed with Henk's efforts on XaAES so I'm looking forward to switch over. I also use PureC, but it hasn't been supported in 8 or 9 years anyway. Other than that I don't think I use any commercial software at all. Oh yes, I use NVDI too. Hopefully fVDI will get TrueType-support in a year or two.

> Oh... for the record, the difference between ASH and Microsoft is that ASH

> has always tried to release and publish quality software, while
Microsoft
> specialises in releasing shit...

I'm working with PC's five days a week and can't say I agree with you
on this one either. OK, Windows is boring, but it works and there are
unbelievable amounts of quality software available (yes, from Microsoft
too). Most free/shareware for Windows is much better than any
commercial offering from ASH.

> ASH doesn't only stand for MagiC, wonderfull programs like Texel,
Artworx,
> Phoenix, Papillon, Signum, RSM, Jinnee...etc carry their logo as well.

I'm probably a sad looser for not using any of these, I just don't need
any of them. I'm sorry for killing the commercial market.

For the ST an ICD compatible host adapter is required. And a hard disk
driver supporting large drives is required.

> Since there is a limit to the size of a partition, 1 Gig on the Falcon and
> using TOS or Geneva you can only go up to Drive P. Would having extra unused

With MagiC or MiNT you can have partitions beyond P:. So you don't have
to waste the space of our drive. It wouldn't cause any problems, though.

Calamus. Calamus 2000 was released recently, and you can download a demo from
http://calamus.net.de/us/

HOWEVER I think that you can only run it in 256 colour mode on the Falcon -
the TC mode doesn't have enough bitplanes. Another story if you have a
graphics card.

You could try Papyrus too, don't know if R.O.M have an English demo of the
latest version yet.

You forgot a very good stack in your list: NOS has been ported from DOS
long ago and it's still very reliable and supported. I used to use it
when STiK was only able to do SLIP. In those days there was no support
for a web browser but you can now use Cab with it.

>
> Also would it be possible to convert the Falcon internal port using ribbon
> cables and connectors to accept PC cards such as ISA or PCI?

Not easily. You would have to design a whole new ISA or PCI
interface/controller or whatever, and then you would have to write the TOS
drivers for your PCI or ISA cards.

> 1 - 2 %, then I have to press IGNORE again !!! The disks work fine when
> copied !
>
> Can anyone suggest a solution to this problem ?

A couple of very important points, and must be remembered are:

1) The latest version is 1.5. http://makedisk.atari.org (it says it is 1.4,
but it is 1.5)
2) Makedisk ONLY works under REAL DOS, not a DOS window under Win98 (because
windows messes up the floppy reading)

The best thing to do is boot into DOS with a boot disk (Win98 one is fine).
And use makedisk from there

```
The ACSI/DMA is for connecting either an Atari Megafile hard drive or an
Atari Laserprinter. Nothing else.

You need an adapter to use a standard SCSI or IDE hard drive.

Check out the Quick FAQ.

This is how the Nova and Eclipse graphics cards work. The Nova consists of a small PCB that sits on the internal expansion port, ribbon cables to an ISA adapter and a ATI Mach64 ISA graphics card. The Eclipse is similar except that it use PCI.

I don't think it's possible to use the Nova-interface for anything else than the ATI graphics card. The PCI-interface in the Eclipse can theoretically be used for other purposes too, as it has a PCIBIOS which is compatible to the one in Hades and Milan. It doesn't support bus mastering though, which is a serious limitation.

I often prefer a more powerful iron as this
allows very quick working of the solder,
therefore less contact time for heat to
damage the component. True, more heat
in less time is probably the same energy
as less heat in more time, but if you can
quickly work the solder it's no hassle to
blow the joint cold again straight afterwards.
Saves a lot of time instead of waiting for the
solder to melt with a weak iron (which gives
more chance of dry joints).

Hi Pete,
I've been playing with the settings on BacwardIII (don't have 2)
and got a lot to work with similar settings as your suggestion but
only keyboard control and not all of that either. I can fly around,
fire different weapons, use auto pilot and more but locks up if ESC,
HELP and some others are hit. Maybe it also has to due with having a
different keyboard than an ST (extra keys?).
Thanks for the feedback.

That's absolutely the top priority - otherwise they can't be trusted to stand up to warranty responsibility etc. Suppliers are the top priority for all companies, so where do you think an ordinary customer will be in the priority chain?

I wouldn't trust this for a minute. How long did we hear about Wizztronics' fantastic 040-card, which also was advertised for a couple of years as being under development and very close to production - or even claim that prototypes have been made for evaluation?
This Tempest card is probably still nothing but wild plans, to check out if they can get any pre-orders and maybe make some money out of pre-payments from easily fooled users who are desperate for any news...
The big problem is that most of the users have already stopped supporting such ventures. Most people have already changed platform and a lot of users won't get anything new - they just continue using what they already have. In many cases they're just waiting to afford a platform change :(
Sorry to be this negative, but I've seen too many cases of vaporware during the years :((

Hi!

I have a Falcon, and I have a new LS-120 Panasonic SuperDisk 120Mb/1.44Mb drive which is sitting nicely in my Falcon's case.

I have HDDriver v.7.x

What I would dearly like to do is to get all this working!

I'm told it's feasible, and that people have done it.

The LS-120 connects to the floppy cable and the IDE cable.

At the moment, I have a 1.2Mb Seagate HD on the SCSI, configured to C for boot D, E and F.

I'm desperately trying to get a ZIP drive going on the SCSI bus, to back up the Hard Drive.

Can any kind soul help get this show on the road, please?

Pretty please?? >:-}

Yeah, but that's a completely different company. I personally haven't seen much of anything produced from Wizztronics as promised. However, I have seen things produced from Titan/Cortex (Nemesis, Eclipse, etc.). Also, they're not the only people behind the project.

> This Tempest card is probably still nothing but wild plans, to check out if
> they can get any pre-orders and maybe make some money out of pre-payments
> from easily fooled users who are desperate for any news...

Well, if it matters, they do have an image of the circuit board on their new web site. As well as some updated benchmark info. Besides, they promised for a long time to release the Eclipse, and although it took a lot longer than promised and angered a lot of people because of it, they did eventually get the thing produced. How can you say that Tempest will be any different? You're just guessing by way of previous situation seen with a completely different company.

> The big problem is that most of the users have already stopped supporting

> Sorry to be this negative, but I've seen too many cases of vaporware during
> the years :((

I've got a Mac as well as an Atari. I like the Mac ok. It's better (for me) than a PC. But I enjoy my Falcon much more, and will buy Tempest when it is released. You're right, though. It comes down to user support. If there are too many of us that say, "Because other products from other companies have

been vaporware, I won't believe it," and refuse our support (monetary or non-monetary), then it'll be a self-fulfilling prophesy. I know for a fact that this company is capable of producing hardware, because they have in the past. Being the eternal optimist that I am, I think they'll do it, even if it takes longer than expected. I hope that the inability of other companies to produce their promised hardware doesn't tarnish this company and make people believe that this thing can't and won't happen. That would surely spell the death of any future advancements in Atari hardware, from any company. And as I said, we really don't have anywhere else to turn. It's either hope for the best with these few companies we have, or give up on what we do have and be forced to never have any more advancements in the Atari world, hardware-wise. If there is to be any more hardware development, we need to take a more balanced approach. Rather than saying, "I refuse to support any of the hardware-producing companies anymore because we've been burned by a few other non-related companies," and on the flip-side, "I'll give my money in advance to anyone who rumors they'll make hardware," we need to support the companies by being more optimistic and encouraging, but not gullible. I personally hope and to a certain extent believe that the Tempest will be released, but I won't send any money to them until I can be assured that the cards have been produced and are now shipping.

So, if you don't believe it'll be produced, that's fine. Don't. But don't encourage everyone here to completely discredit one of the only companies we have left.

But we did not take people's money and run - in fact, we did not cash
cheques we received. If we had cashed some cheques (and money received
via credit card) then we have already refunded most people with an apology
note. I believe there are still a couple of customers left who we need
to refund, but that is it. Also, we have paid off most authors too.

I believe this is different from Titan who simply do not pay...

This makes an addition to my point. When a company doesn't even pay it's
bills - how can one ever believe they have the funding for development of a
new card, like the Tempest?

People only use what they know about. Most people I know with a PC and
internet access don't know what newsgroups are, and have a generally
sanitised selection of tasks they do. 'Because thats what it came with'
is the mentality they have. Many Windows users I see today wouldn't
know what DOS stands for...

Also true my friend! But try telling that to newbies in the computer
world (there are lots of them) who know nothing else. Ones who think
that it is 'necessary' for these things just to get by.

Some of us know better of course! ;^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

So far, only the Nemesis was their own design. Both Eclipse and Tempest
have been designed by a swedish Atari fan who made the thing in his
spare-time, so to say that they've been deeply involved in the development
would be a lie.
Who knows - maybe the Nemesis actually was the result of a similar project,
with development done by a die-hard Atari fan who's an electronics expert
and made the complete design on his spare-time...?

> Well, if it matters, they do have an image of the circuit board on their

> You're just guessing by way of previous situation seen with a completely
> different company.

That's one of the causes why people are running to other platforms.
Everything takes too much time. I waited for 2 new fantastic 040 or 060
accellerator boards for about 2-3 years before I got tired of waiting for
something that eventually never came. I needed more speed at the time
because I was sick and tired of my Falcon's poor performance, but noone
could provide a solution. Everything was vaporware, so I made the switch to
PC without any regrets. I guess very many have felt the same way :(Even
SoundPool have stopped making their hardware for the Falcon now, since the

market's too small. They're just selling the current stock and won't start a production batch until they have an order of 50 pcs per unit. However, their software will be around for a long time.
With other matters about Titan/Cortex in memory, I'd suspect that the reason they didn't release the Eclipse previous to when they did, was that they lacked funding - and a company that's constantly lacking money to pay their suppliers can't be trusted IMO.
When it comes to warranty matters, they must have resources to fix the problems and without money... Well - you get my meaning, right?

> I've got a Mac as well as an Atari. I like the Mac ok. It's better (for me)
> than a PC. But I enjoy my Falcon much more, and will buy Tempest when it is
> released. You're right, though. It comes down to user support. If there are
> too many of us that say, "Because other products from other companies have
> been vaporware, I won't believe it," and refuse our support (monetary or
> non-monetary), then it'll be a self-fulfilling prophesy.

I think there are too many "Jareds" with impossible dreams around here. People hoping to bring new life to a dead platform. Dont misunderstand me, I mean "dead" in the sense that it doesn't get developed anymore and hasn't in several years - I know there are still many people using their machines because of nostalgia, lack of money to change or whatever - and so would I if I had the time to spare. I even have one of my Falcons left because I didn't have the heart to get rid of it... Just like you, I also convinced myself that I enjoyed the Falcon much more than the PC at the time when I used both, but I couldn't fool myself in the end and I became aware of some of the things I had been missing when I started using Cubase VST instead. I don't think there's a big enough market to produce any advanced hardware for Atari machines, simply because the development and producing costs will be too high. The only way to go is to get solutions for free from enthusiasts who develop in their spare-time, but it seems to me like Titan/Cortex aren't the perfect partner to make the project come true, due to the costant lack of money :(

> I know for a fact
> that this company is capable of producing hardware, because they have in the
> past.

Why did they stop producing the Nemesis then - and why did the price go higher and higher, even though it was a rather small card that must have been simple and cheap to produce?
Nemesis was very popular because it was cheap and gave something extra relatively easy - but an accellerator card which will cost UKP200 (a guess according to their site - so it'll probably be more expensive if it ever sees the light of day) will certainly make people ask themselves if they really need it - regardless of the specs.
It's a pity the Tempest card wasn't released a couple of years ago, when

there were still enough of a market. I saw in some mail that the Centurbo had been sold in about 200 pcs totally. That's not a big market considering that it's sales around the globe. The people who bought the Centurbo are probably the ones most likely to upgrade to the Tempest, since they probably still use their machines and they've updated recently to get more speed. However, many of them probably think it's enough and maybe they don't dare to buy more because they plan on changing platform in a couple of years and don't want to sink too much money into the old machine :(I would absolutely think so anyway.

> I personally hope and to a certain extent believe that the
> Tempest will be released, but I won't send any money to them until I can be
> assured that the cards have been produced and are now shipping.

I hope so too, but I believe it will be a tough struggle to get enough buyers if they ever get it produced.

> So, if you don't believe it'll be produced, that's fine. Don't. But don't
> encourage everyone here to completely discredit one of the only companies we
> have left.

I'm just looking at facts and add my views to the discussion and I'm definitely not going to be censored, so don't tell me what I should or shouldn't say!
SoundPool - who have been with us for a very long time and made lots of musicians happy with their hardware boxes - have stopped producing due to the vanishing market. If Titan/Cortex is the only company left - what does that actually say about the market? Dead is one word for it - and I'm very sorry for that since I've always really liked working with the Falcon - and all the other Ataris I've had, ever since the first 520's came. When I got my Falcon, I actually made a promise to myself that I would buy ALL add-ons I could find, so I could use it for anything. I got tired after a few years (and a LOT of money invested in the Falcon and stuff for it), as the development went into a decaying state, where less and less gadgets were released :((The PC simply proved to be better for everything but the music - but nowadays it beats the s**t out of the Falcon in the music area too.

> advertizing = few users. Too few users... why spend money on advertizing?

My memory of Atari advertising was that I saw it only in Atari
magazines, so
how do you attract new customers by advertising only to those who already
are Atari users? You're 100% on the dot with that one. The market coverage
IMHO was pithy...

> > We've already been promised PPC this and 060 that, most of those promii(?)

> is not the original, and people know that. And people are leaving. And people
> like Lonny still go ahead and pay good money for a system that may do them
> well, performance-wise, but will hardly maintain long-term support...

Thats true, but I also think 'clone' is a loose term. C-LAB make the Falcon
MK I/II/X etc...using the exact same motherboard and bits, but should
they be
considered a clone? People say they are a Falcon clone, because the only
significant difference is a tidy up of the audio and SCSI systems. The
mainboard is identical as is most other aspects so that to me is a true clone.

Then we have the 040/060 TT clones. These 'clones' are not clones really
because they have bits the TT never had (PCI/040/060 etc...) so therefore
I think they are more a 'progression' than a clone or copy of the original.

> You can call me what you like. But realize one thing... I am only trying to
> help all of us... past, present, and future... by trying to get people to

I do realise your intentions, but as an Atari user for the last 12 years all
I have seen is the platform grow very old, with only updates to 3rd party
stuff keeping anything happening at all...

> > Profit? Not likely...we've proved that we're not interested in rescuing

> anymore. At least no new ones. And THAT'S why no one cares.

We wont see any new ones either. The platform is now too far removed or
behind for the money men to step in and rescue it. Money talks, which
is sad I know, but thats the way of things in this overly false society...

> otherwise? I don't think so. Letters and Emails, alone, to Hasbro won't
> make them change their mind. They have no interest in Atari computers.
> What I am proposing is that we try to give them a *reason* to be interested.
> Is it really so difficult?

What do you propose? Hasbro, to my belief, is only interested in the buying
rights to Atari technology (which is now getting on a bit). I'm sure that
the sum total personal income of ALL Atari users left on the planet would
only go part of the way towards a feasible 'rescue' mission...

> Why don't we stop arguing that I'm a blithering idiot out on a grand scale
> experiment of mental masterbation and start believing that what I'm saying
> just *may* be possible.

You're not a blithering idiot. I'd like to see a return to 'the good ol days'
too, but I'm not gonna hold my breath waiting. As much as I'd like to stop
waiting, and start making it HAPPEN, thats not an option because Hasbro are
not interested and they are a slightly bigger (he said understatingly!) fish
than me or all of us combined!

> Maybe I'm so out of touch with business reality, I'm clueless to the actual
> fact that what I propose is impossible. But I will not settle for defeat
> until every last step has been taken and every effort has been made and
> Hasbro gives us a definate "No."

Nothing is impossible, but people in ivory towers need to be interested for
'reality' to become other than a dream...as I've said Hasbro ain't there
to resurrect Atari, they are there to collect license fees for devs doing
new takes on old games and thats about all...

> > the point I'm building a CPU box and separate keyboard...why the Mega and

> a computer they recognize.

Yes I do think it was heinous, but as a musician the ST (and now Falcon) did everything and more for me. The problem is that only former Atari users will recognise the case, and as I've said previously those are kinda thin on the ground compared to the user base of Mac and PC users...

What about size recommendations? (I don't mean physical. While I haven't opened the case, the enclosure looks like it was built for a 3.5" half-height drive.) Currently, I'm using a Toadfile 44 Syquest removable and a Club Mac 200 Syquest removable. However, both of these drives have recently given me reason to wonder how much of their useful lives are left. I'd like to put them into semi-retirement as backup/archivers when I put in the Mega STE drive. To do this, I need to know the upper limit of a drive I can use and still be able to access one or the other Syquest. I know I can put BGM partitions on the Syquests and limit the drive letters used. I suppose I could use BGM partitions on the internal HD, but that seems very wasteful when you consider all the short support and data files for programs like PageStream, UltraScript, CAB, Newsie, or AtariWorks. Suppose I set up part of the internal HD as Spectre GCR/Mac partitions? Would ICDBOOT ignore them when booting as an STE?

> world (there are lots of them) who know nothing else.

And some of us older computer users as well. I got my first computer, an
ST in 1985 and loved the thing.I have used computers on a daily basis
since then. I reluctantly got rid of the ST in about 1991, but got
another one last year. I determined to see if I could use it as my
everyday machine, but it was impossible. The difficulty and expense of
getting it do simple everyday computing tasks was beyond me. When I
eventually tracked down respectable wordprocessing software,for example,

it was nearly twice the price of MS Word (not taking into account the fact that I have several OEM copies of MS Office already).There are no spreadsheets that can even begin to compete with 123 or Excel. I had trouble finding printer drivers and font managers and let's not even start on internet software. The general pattern was, I would look on the net for days until I found someone who had a program. He would give me a lecture on the evils of piracy and give me a list of defunct URLs to buy it from. If one of the URLs came up with something other than a 404 message, the prices asked for the programs were laughable. And looking at the capabilities of what the programs would have achieved, I could do better with Windows, only more cheaply and more easily. I suppose I could have imported one of the fancy looking Atari clones, but for goodness sake, why? It would have been very expensive and given me no advantage over what I have now.

I have 3 STs now and a few hundred disks of software, all bought through ads in the paper, but it is all just nostalgia value. I like to get out an ST and have a play now and again, but for main use, I'm afraid it's Windows and the many excellent programs that came with my computer, or which I can download quickly and easily from the Internet or buy easily and cheaply from my local retail store.

> The more I thought about it the more pissed off I got,
> having the nerve to question me for ordering a Hades.

I agree. Hades is a beast that runs the majority of GEM software, which in a way is like the TT, in that it isn't designed to run ST games that make dirty non-standard hacks at the system. With an 060 you can expect the Hades to run that GEM software at what I'm sure would seem crazy speeds (hang on to your hat, Lonny!). As an example my Falcon has an FPU and 32MHz 030, but running a 3d renderer called POV-ray the Hades is about 90 times faster. Yes I >DID< say 90 times. Who WOULDN'T want a piece of that is my question...I would (almost) die to own one...

> Your hardware ideas thus far have been a joke and your business
> sense is nonexistant.

I have to agree. What sense is there in re-inventing the wheel?

MiNT and MagiC provide good featured OS for existing hardware both original and clone, and with Hasbro playing dead on the source to TOS/GEM issue we have no option but to go with these other OS options. Thats no loss...current MiNT/MagiC and the associated GUI's are a vast improvement on what the latest TOS/GEM source would present...

Neat! But, that jingle was used mainly for the 2600 IIRC. When they
were running ads for the 8-bit computer line, the commercials used this
classical song which for-the-life-of-me I can't remember the name of. I
even used to have an AMS file of it!

I'd rather waste some space on larger clusters than being restricted by small partitions. Also, if you use FreeMiNT or MagiC >= 6.10 (IIRC, correct me anyone if I'm wrong) you can use FAT32 partitions have have large partitions with as little as one-sector clusters. You need HD-Driver to use FAT32 though.

> Newsie, or AtariWorks. Suppose I set up part of the internal HD as Spectre
> GCR/Mac partitions? Would ICDBOOT ignore them when booting as an STE?

I really can't say, as it's been many years since I used ICD. I stopped using it because it wasn't XHDI-compatible and because it didn't work properly under MiNT and MagiC.

4948. ST for sale - Munich/Germany

Newsgroup: comp.sys.atari.st
Date: 2000-10-31 08:35:23 UTC
From: Martin Grundmann <martin.grundmann@icn.siemens.de>
Message-ID: <39FE844B.A58E775E@icn.siemens.de>
Source record: 55327

I still own an Atari 1040ST equipped with
s/w-Monitor,
2,5 MB RAM,
90 MB SCSI harddisk,
10MB SCSI removable disk,
lots of SW and Documentation

Due to a relocation I will not have enough space to keep this system. Is somewhere out there in the Munich/Germany area who still could make use of this Atari ST ? Price: A little bit more than free.

Other parts for sale:
- Original Apple II with lots of add-ons, SW, Doku
- Apple II clone
- 68000 single board computer
- Printer NEC P6

Please reply to Martin.Grundmann@computer.org

er.. which PC are you talking about? A bogstandard - or even a good PC
can have far less functionality than the Falcon with regard to MIDI etc.
It is still true in the UK that for 200UKP you will not get a PC with
much sound capability. I suspect you're talking about PCs for over ï¿½1k.

>drive which is sitting nicely in my Falcon's case.

Should work, but you'll be b*ggered if the LS12o fails. With no floppy to
load a hard disk driver from you'll also lose access to your hard
drive(s).

>I'm desperately trying to get a ZIP drive going on the SCSI bus,
>to back up the Hard Drive.

This will also work, but I believe that you can only use SCSI ID5 or 6 on
it, and that you have to make sure that another drive in the chain is set
to provide termpwr to the bus. There's also the termination issue - only
the last device in the chain should have it set.

Hello,

How would you guys like to have a WEB database (cab compatible of course)
user maintained about the atari stores left in the world?
It would work like this:

User can add Store Entry (i.e):

Systems for Tomorrow: (tel number): Location:

Then have users (unrestricted) to "vote/rank" the store they had
experience with:

System for tomorrow: 1 to 10 -> 7
Comments: Decent service, okay prices, up to date stock blah...

And basically have a "Best of" list of store/resellers.

Of course developers such as Mario Becroft could be considered a "store"
too as he sells merchandize.

What do you guys think?

```

Hello,

My Falcon has decided not to like my AB-card :-(
I have had the AB installed without problem for some years now. I have also made a digital 030/040 switch based on Geir ï¿½yvind Vï¿½lidalo's switch.
But now I have made the line level sound modification on the sound ports. (This seem to work perfect by the way.) Something must have happened because now the computer won't start when the AB is plugged in. The following has been observed:

Without the AB040 (and the jumper between pin 20 and 22 on expansion connector J20): Everything is perfect, every time.

With the AB040 plugged in (the jumper on the AB card):

Switch in 030 position (disabling the 040):
- about 20% of the times everything is ok.
- the rest of the time (80%), the computer does not reach the white boot screen but the monitor shows flicker in dark blue or red.

(when things are ok the characteristic two dark gray fields are shown in the topmost part of the screen before the boot screen. When things don't these does not appear.)

Switch in 040 position:
- about 5% of the times everything is ok.
- the rest of the time (95%) the white boot screen is shown but the computer crash before the whole fuji logo is drawn.
(is just freezes half way.)

I have tested removing the 030/040 switch with the same result.

I have checked the clock patch with an oscilloscope.

I have removed and reinserted the memories.

Anyone that has any idea of what could be wrong?

/Jonas

Hi Jared,

>You know, I had a relatively brilliant idea hit me today (provided it
>hasn't already been thought of or done). Instead of emulating ST hardware,
>why not make a PCI card that has the ST right on it!
Soryy mate... back in 1994 the German based firm VHF-computer had the same brilliant idea and produced a card called the Janus emulator. The card came with a 68020 processor, it's own memory (SIMM) and TOS 2.06.
On a 486DX2 the Janus/020 was nearly 40 times faster then a TT (measured with GEMbench 3.0), in a resolution of 1280*1024 in True Colour.

>Not just the ROMs and/or one or two parts, but 95-100% of the ST's hardware
>on it!
There's no need really to use 95-100% of the ST's hardware, the Janus has proven this.... The Janus took advantage of the PC's hardware, it could even use the network card...

>In order that you could run this "ST card" on a PC or PowerPC motherboard,
>using a standard video card, you would probably be best to emulate the
>video shifter, so that you can run the ST in a window on your main OS.
Ever heard of NVDI?

>Now, assuming any of these is reasonable or feasible or worth pursuing at
>all, we port GEM or MiNT or whatever ST-derivitive OS to PowerPC (if we
>want to go that route) or Intel Pentium.
It's not worth persuing at all... I cant't see any reason at all why one would want this card, MagiC for PC and Mac does the same thing and IMO does it rather well... people who only want to emulate a "simple" ST can use programs like Gemulator, WinSTon, TOSBox which are free...

>The ST would run at full speed. The hardware would satisfy *all* software,
>because it was genuine, not emulated. You could even run those copy
>protected games on diskette (assuming you have any)!
Why would anyone go through that trouble? all one needs to play those games is an original ST, these can be picked up for free nowadays, how much is your card going to cost?

>Then, we take the opportunity to use the ST Card to port as many existing
>apps as possible to the new GEM on the chosen processor. We have the best
>of both worlds!
I suggest to go to your local shrink and have your head examined, why on earth do we need a new GEM? porting existing apps? except for some long forgotten crap, all modern apps work just fine under software emulation.

MagiC or MiNT running with a modern desktop (Jinnee or Thing) will be very hard to beat...

>Any ideas if what I have just suggested is pure silliness or not? Seems at
>least a little more reasonable than my previous ideas... hmm?
I think you should see a doctor ASAP.

Jared, I know you mean well.. but you're getting on a lot of peoples nerves with you're obsession of releasing a "new Atari". If you really want to contribute then get in touch with Milan Gmhb, they share the same dream and at the moment need all the support they can.

Oh.... just in case you're wandering what happened to the Janus card...
In 1995 Gemulator and TOS2WIN were released, costing a fraction of the price. Intel en Motorola kept cranking out ever more powerfull processors meaning that under software emulation one could reach higher speeds then with the Janus... and that ment the end of the Janus card.
There's a lesson to learn from this: no one in his right mind will pay hundreds of dollars for an "ST on a card" when the same thing can be bought for a fraction of the price and works just as well.

Cheers from Belgium
Dennis

There is not much you have to to except for jumpering the drive as slave
and connect it to the Falcon's IDE port. You may need a special cable
for that so that the internal drive and the external drive can be
connected at the same time. Ensure that the cable is as short as
possible.
As far as setting up HDDRIVER is required everything should be mentioned
in the manual.

Regarding HDDRIVER the registration requires sending me the original
floppy disk with the serial number on it. Each legal copy has such a
serial number.

When I have had problems like this in the past, it was almost always a problem with the clock patch somewhere. Do you use a resistor near the DMA connection? I don't have the 030 switch installed, don't know what to look for. Other problem with my Falcon was a bad GAL, but the machine was dead black screen, not white screen. Somewhere there is a bad clock it sounds like.

To get pro porformance out of any system, you have to add quite a lot of extras - even to the Falcon. It's not useable as a bog standard if you're not going to do anything but play around. You need digital interface, I/O-expansions, midi expansions etc before you can really make use of it. You also need an extra SCSI harddisk for recording audio with CAF.
The same applies to a PC, where you need a larger RAM than in a bog standard machine (at least 128MB) - and you need a good soundcard and a good midi interface, as well as a separate HD for the audio - but you can use the cheaper UDMA-disks instead of SCSI if you're not opting for top performance. Otherwise it's a standard machine. Mine is actually below standard, since it's a PIII450 with 256MB RAM, an UW-LVD SCSI for the audio, RME Hammerfall soundcard and an Opcode midi interface for the serial port. With this system, I easily get over 50 (!) simultaneous audio tracks with sample-accurate sync - and as many midi tracks I'll ever need - also with sample-accurate sync, which is better than ANY Atari system. Besides this, I get a program VST/32, which is constantly updated and has a LOT more functions than the Falcon can ever handle. Actually, if the Hades or the Milan would have worked with CAF, I would have bought them a couple of years ago, to continue supporting the developers, but I have no use for a machine I can't make music with - with professional software, so there would have been no mening with that...
Over ï¿½1000? Way over - without a doubt, but that's not the issue. I paid about ï¿½3500 for my original Falcon system with all the necessary add-ons (which was very cheap at the time for a HD-recording system with 8 audiotracks), and thats somewhere around what I've paid for the PC as well - so a price comparison has no relevance. For the same amount of money it cost me back then, I get tons of better performance and I'm also compatible with the rest of the world and have a lot of software to choose from, so it's worth the investment again because of even better functionality. I want tools I can use effectively and I don't care one second about the brand name. If it's good it is - and if it's not good enough, it isn't. When I got my Falcon, it was superior to anything (within reasonable amounts of money) - and besides, it was just about impossible to get a PC to work, so I didn't have much of a choise back then either, but today, the Falcon can't be compared to modern computers. At the most, I had 3 Falcons, to make sure

I always had a working one if the main machine would break down - and to be able to do different things at the same time. Luckily, it never did, but anyway... Nowadays, Atari machines are extremely cheap on the second hand market, due to people abandoning the platform, so they're very well worth their price, but I needed more power and a more flexible system, so the PC was the way to go... You can't actually compare an Atari with a normal PC today - both design and performance is years back on the Atari platform due to the extreme development pace for PC's. People who say something else don't have a clue of what they're talking about and they probably compare their Atari with an old 486 or some other unusable relic.
You actually do get what you pay for in many cases...

[snip]

It looks like a DMA/clock-patch problem of some sort. When I've had problems like this (usually caused by the Nemesis or it's clock-patch) it has always been a cold solder-joint, broken trace (not unlikely considering the nature of the line-level fix) or that the DMA-patch needed tweaking.

You should also check the DSP and the DSP-clock if you've done any mods there.

I actually had a dialog going with Fleecy about that, it progressed
to the point where I was told it could not be ruled out, nor
could it be considered without more information. Fleecy requested
my help in getting statistics on the numbers of Atari users
and such... however I would not know where to begin to start
counting or how to have it accurate. I wrote back asking for
advice on how to tally up such numbers, where apon the dialog
stalled. I never heard back.

I still have Fleey's replies in my tempbox in my mailer.
What suprised me was he replied at all.

>
>In Interlace mode presumably?

I can get 800x600 True Color Mode on my MAG 17' SVGA in interlaced and
Non-interlaced Mode. :) If I had a true Multi-Scan monitor that would Sync
Down below 30kHz Horizontal, I'm fairly sure I could go higher in TC Mode.
Right now I'm getting 800x608 in TC mode around 29.xxxkHz, Using CENTscreen
and CENTvidel. Which does allow you to play around with the Horizontal and
Verticle settings. It took some experimenting to do it but it does work and
is as Clear and Stable as normal 640x480 in 16 Colors on a VGA and is as Fast
or Faster with Screen redraws, Text Scrolling and etc.

Thanks to everyone who posted and e-mailed info on DTP and WP packages.
I appreciate it very much.

Actually, all the amiga`s had an internal expansion port.

The A500 also had the external port at the side along with a trapdoor
usually used for memory expansions.

The trapdoor allowed upgrades like processor accelerators and PC emulators
to be fitted. It was an internal edge connector that carried all the
datalines and allowed expansion without removing the case.

The trapdoor expansion slot is where the PPC upgrade fits on the A1200.

The big box amiga`s also had numerous internal zorro slots and a video slot
to allow items like the videotoaster to be fitted.

There was a commercial game called Dyna Blaster that came with a hardware device that you plugged into the printer or serial port, (can't remember which port right now) which gave you two extra joystick ports.

I have the hardware device here and suppose to have the game here somewhere also. Anyway the device has 25 Pins on one side and 2 9 pin ports for 2 joysticks on the other.

Wonder if this could be used somehow as 2 extra modem ports???

> <Block Cut and Saved>

This is a very interesting Thread.

I waited along time to get a good upgrade for the Falcon.
Titan/Core never seemed to be interested in the USA market except for
the Nemesis. Some of those did make it over here.

When I had the chance to get the CENTurbo II B version. I jumped all over
it. And it is worth every penny I paid for it which wasn't that much
for all that it does.

I know some folks have had problems with it. I don't know of any hardware
upgrade that someone has had problems with. I for one could never get
my 25/50 Nemesis working. But my CT2B works GREAT!

Also, some have had problems with CENTEK. Again someone always has a
problem or 2 with any company that produces Atari hardware.

Now is an important time for any Atari User that wants Hardware Upgrades
for their machines. The Fact is that the TT and Falcon are 2 of the best
Atari machines ever made and sold in fairly large numbers.

ST/STe/MegaST/MegaSTE owners should upgrade to a TT or Falcon if they
want a more advanced Atari system.

Also, Falcon owners looking to upgrade should really consider getting
involved with the CT60! If this upgrade comes about and works as
great as the CENTURBO II B, then it will be one hell of an Upgrade!

But if folks don't get involved and show that these upgrades are wanted
then we will soon see the end of development for Hardware upgrades.

Companies such as Titan/Core need to gain the respect of the Atari Users
again if they want to be taken seriously. We all have seen to many
promises broken which only leads to the loss of Atari Users.

I very much want to see the CT60 produced and any other hardware upgrades
for the Atari machines.

I know this is an Atari NG, and I'm going to get singed for mentioning it, but in a Linux emag, I found out the Amiga people are at least moving on the issue of new and up-to-date hardware for their cross-platform OS. See http://www.amiga.com/products/one/

Sometime late next year, they hope to have a PowerPC-based motherboard with PCI expansion, lots of standard I/O, in an ATX form-factor, at prices quoted elsewhere at ca. $500. A well-established Amiga hardware house in UK is leading the charge, followed by a German outfit.

Just interesting after the firestorm we've just been through on the same issue from an Atari viewpoint.

('twould be cool if we could use THEIR hardware product for OUR new PPC-based Atari. Depends on how open it will be. Probably not enough.)

Sounds like a wonderful idea! I'm sure one of the larger Atari sites
wouldn't mind offering web space for it either (www.atari.org, for example).

A few suggestions, if you don't mind...

Next to each store listing, there should be a catagory. For example, if I'm
looking for an upgrade for my TT, I'd like to easy skip stores that only sell
software or ST upgrades.

Your vote/rank and comments idea sound like a fair way for customers to
choose stores. This is similar to the eBay procedure... if a seller has a
high rating and lots of positive feedback, it is probably safe to buy from
them. It also causes crooked or slack dealers to smarten up! :)

Perhaps you could set up a test site with two or three listings. Invite
people from this forum to test it. Once the listings and layout are
perfected, then it's just a matter of compiling the stores/sellers.

I hope to see this project become a reality.

As long as I can find a server with sql server and php4 installed, that's
ok. Until then I will have to run it locally.

hm yes, but keep in mind that I want this project to be "users"
maintained.
That is, if too much freedom and too flexible, it will be a mess very
quickly. I guess, unless someone has a very precise layout I should
follow.

I did make a note of how it was made, and I don't think extra ports
would work. IIRC you couldn't use autofire on the joystick that use the
adaptor!

Cool idea, I think Mike Kerslake had a similar one a while ago. The only problem I see is "user maintained". Although many users read the instructions well, some don't. So there should be a way to avoid multiple entries.

> GEMbench has never been a reliable benchmark so who knows...

These were the benchmarks VHF published... the Janus was really fast in
dual mode where speed depended much on the graphic card.

sometime late next year, huh?

interesting - let's hope that, for once, this proposed Amiga actually comes out. The Amiga market has a history of being disappointed with promises made but never kept, especially the vapour fiascos by Escom and Gateway. And you thought the Milan II situation was bad!

>
> Just interesting after the firestorm we've just been through on the
> same issue from an Atari viewpoint.
>

This is especially interesting because s*****p has been swearing up and down in .advocacy that the new Amiga is going to thoroughly crush the Atari market. Glad to have confirmation that right now the existance of this new Amiga for sale is quite a long ways off.

(oh, and by the way, if you want to see s*****p thoroughly sporked, check out .advocacy now, he's being clobbered in the wake of Apple's "speed bump", especially by TAF member John "Razor" Rikel. s*****p is in full denial mode, much like Cartman when he took the Weight Gain 4000 :))

> it sounds like.

Both of my Falcon's have karked it in the past in simillar styles. One was a Rom with oxidised legs, and the other was a GAL that had been butchered by the previous owner, attempting to do a clock patch. The GAL's leg was actually broken and it was only tesile contact that caused it to work at all. First things to check with any Falcon is ROM, GAL's, and 68882's for oxidation....

Depends on what you believe of their bull****.

Me, I'm not exactly sure this will be an amiga, or even an amiga clone.
I'll have to wait and see, to tell the truth. WHat I've heard up to this
point though, is far from encouraging. First off, there will be nearly zero
transition from the old amiga, to the NG (this may have changed, still
trying to sort through all the PR crap). Second, they insinuated before that
hardware is unimportant, why try to make their own when there are plenty of
macs and PCs out there already (sound familiar?). In other words, they are
too much a bunch of candy-assed faggots to do anything real. Third their
"DigitalEnviroment" isn't even an OS in the traditional sense, but some
bunch of PR-hype crap that isn't sure whether it wants to an emulator
foundation, to run windows and macos off of, or a software package that
emulates classic amiga on top of said operating systems. Fourth, while it's
commendable that they are trying to off-the-shelf most of their reference
platform parts, the specs lack any sort of 'soul' in my opinion.
My conclusion: If any platform has won this pissing contest, it is you
guys and your atari. Both may be dead, but you got the last breath in, and
you managed to use it to laugh at amiga. The company masquerading as "Amiga"
is just some loser tech company that saw venture capital dry up, and decided
to buy a name with the last of it.

Wrong score.

L. Pursell -50 for technical fouls, unsportsmanlike behavior, and pre-game sabotage
J.Falvo 0.5 points (20 for enthusiam, 5 for ideas, -24.5 for foolishness)

>By virtue of Mr.Pursell showing he is truly in support of the
>platform, whereas the 2nd combatant, whilst he is enthusiastic,
>needs to realise the enormity of what he asks.

Hmm. Sorta like all those christians that truly support christ by blowing up abortion clinics.

>His offer of
>$150 is thrown out, as $150,000 would not even get him started...

Depends. For this business of his? He could flush 150 mil down the toilet, and not earn a single dime back. However, $150 is not to be scoffed at. That would make a sizable dent in a hobbyist project, assuming he actually had a clue about building hardware. So while he is merely ignorant, asking the best way he knows how, you are a moron trying to shoot him down.

>...and as for the foulmouth in the bleachers...security remove

First ST was 1985, Falcon was 1992(I think), STE was 1989. But it all
depends on which part of the world you are from. Germany got most of the
machines early while Australia never saw them all:-(

Ahh, I see.... So the Megafile Harddrive was some sort of
proprietary Atari hardware, If I find one of these, can I
retro fit it with higher capacity drives (say 1~4Gb)?

But parity is ignored by everyone, isn't it? At least in the old days, 9-bit
SIMMs were only of particular interest to PCs.

>>The problem on the SIMM becomes a problem for the user.

>If the SIMMs are broken, bring them back to your dealer.

I'd really like to see what they would say if I brought back to them a SIMM
which worked fine in all of their machines due to it malfunctioning in a PS/2 or
Atari.

But do you really need 50 tracks!!

>sample-accurate sync - and as many midi tracks I'll ever need - also with
>sample-accurate sync, which is better than ANY Atari system. Besides this,

I was pretty damn close to sample accurate with CAF, RD8, Z-system SRC,
ADAT interface. Close enough and even with my Mac setup VST, 2408,
either Opocode Studio 64xtc or a MOTU MTP AV I can only get sample
accurate sync by jumping through hoops (MOTU doesn't exactly directly
support ASIO 2)

>I
>get a program VST/32, which is constantly updated and has a LOT more
>functions than the Falcon can ever handle.

Essentially the midi has not change at all (mostly colors) on the MacVST list there has been a lot of requests for the midi editing functions to be updated. VST ver 5.0 midi hasn't changed much either.

There is a lot more one can do with a PC or Mac and the biggest advantage is the speed at which they can handle audio & video.
My Mac is a G3 300 with 320meg ram and two 18gig HD (one IDE one UW2)
My Falcon has a working Afterburner 040 and Nemesis installed by Titan and shipped back to me in the US with no problems. Charlie S. even tried a quick code change with some 040 tips from Doug of Black Scorpion fame but it never really worked (tried to get CAF to use FAST ram for audio) but this is a whole different story.

AFA midi work. If all I need to do is midi, all I'll use is CAF. Partly because of OMS.

Sorry for the rambling

Rich

Dennis, you're being far too polite :-)

The truth of the matter is that DDP Translations (and others, including math
teachers etc) put a lot of time and effort into an English translation of
Texel. We were rewarded for our work with continued silence from the author.

Kind of leaves a bad taste in the mouth actually.

I was able to repair a broken IC leg by milling down through the plastic
package from above with a modelmaker's drill and end mill. There was
enough of the leg revealed to solder to.

This won't work with an SMD chip of course...

Angus,

Many Atari user groups and publications started to see the 520ST's showing up around May of 1985, however the first official batches of production ST's all show 9/85 underneath. The first batch of ST's did not have TOS in 192K ROM's but on diskettes, also while Atari spec'd out the initial 520ST's with RF modulator, the first run of ST's did not have any, the motherboard had a spot marked out for an RF modulator and you could easily add one in yourself, the case did not have the opening for the RF plug or the channel switch, the later 520ST's would come with RF modulators.

You really didn't understand this did you?
The new Amiga OS will be a lot like Java or Linux, in that it can run on
most hardware

There WILL be a new Amiga machine, Eyetech are developing it and, unlike
Centek or Milan, actually finish things.

> In other words, they are
> too much a bunch of candy-assed faggots to do anything real.

Thats lame coming from an Atarian. Just think about Milan, Centek, Roldolf
Czuba. Vapourware at it's best.

> Third their

> emulates classic amiga on top of said operating systems.

The OS runs natively under the hardware. That is, there will be Mac versions
and PC versions of the OS as well as the true Amiga version. The fact it
can run applications with no changing is nothing new. Java has done it for
years, and even Linux has it to some degree.

> Fourth, while it's
> commendable that they are trying to off-the-shelf most of their reference
> platform parts, the specs lack any sort of 'soul' in my opinion.

I agree with the lack of soul, but these days most users want the cheapest
option, and the cheapest option is using off-the-shelf parts ie PC hardware.
Can you say Hades or Milan? They are just PC's with different motherboards,
virtually there.

> My conclusion: If any platform has won this pissing contest, it is you
> guys and your atari. Both may be dead, but you got the last breath in, and
> you managed to use it to laugh at amiga.

Laugh at Amiga? It should be the Amiga community laughing at us, since we
keep falling for idiots like Milan who promise things and don't deliver.

> The company masquerading as "Amiga"
> is just some loser tech company that saw venture capital dry up, and

Hiya

Not if I have anything to do with it:) I've got tons of pictures in IMG,
Tiny, Degas, Neochrome and others in my PD library.

The homepage is:

www.last-pd.co.uk

The good news, for those that have been waiting, as soon as I get a
replacement PSU for the Falcon, I will have finished the mammoth task of
cataloguing the former LAPD library by the end of the year:))))

If it arrives this week! fingers and **** crossed:)

Compared to the Amiga's counterpart (A1200) they are the Rolls Royce as
far as prices go. They are sought after machines.

There wasn't a glutt of Falcons in the UK when they were introduced, and
it took a while (usual Atari delays) to get a machine in the high
street. Prices did start fairly high compared with the Amiga 1200,
presumingly due to expensive chips and many extra features.

Jared Falvo (luposian@mailcity.com) wrote:
: However, in examining some schematics for the 1040ST, I have learned some
: things I didn't know before. That all your data and address lines tie into
: one trace that intersects different chips and components. I learned that
: the Yamaha chip was used for the printer port (I kinda knew this already,
: years ago, but seeing it kinda surprised me). Why? Seems silly to me. And
: that the WDC floppy controller was used for the HD port also. It suddenly
: dawned on me why... that controller was probably an RLL/MFM chip... hence
: why you needed a convertor for using SCSI.
..
: The Atari 1040ST, though it was hampered from the beginning, was an
: interesting piece of design. I marvel how they used a sound chip for a
: printer port and two Motorola ASIC's for the MIDI ports, etc.

This has to be the funniest thing that I have ever read from someone who claims to have the knowledge to design a computer. Do you mean to say that you have designed systems in which the data and address busses do not connect to multiple components? If so, you must have invented a revolutionary new way of transferring data without wires. This invention could revolutionise the computer industry! Why haven't we heard about this before?

Using the parallel port on the sound chip for the printer port is a perfectly natural way to do this. And as for the WDC floppy controller being an RLL/MFM chip that is also used for the HD port, this is just complete nonsense. The chip used for the MIDI ports is not an ASIC, it is a standard part that is used for this application all the time. Nothing to "marvel" about.

People would take you more seriously if you demonstrated an understanding of the subjects which you are talking about. As it is, at least I got a laugh out of your article. But that is about all that it is good for.

Right, and approximately a $1,000,000 in development time which has to be
reclaimed somehow. You don't think it would cost a million?
Think about the man hours involved in designing, the prototyping to
production, debugging, software development, support... all these people
need to be paid too!

>If I thought I could manage such a beast myself, I'd gladly build my own.
>But I'm just getting into hardware hacking, I might be able to do my own

5033. Using an Atari SC1224 as S-VHS monitor?

Newsgroup: comp.sys.atari.st
Date: 2000-11-01 18:54:43 UTC
From: Thomas Sahlin <thomas.sahlin@home.se>
Message-ID: <8tpovq$7rn$1@cubacola.tninet.se>
Source record: 55211

Hi!

Is it possible to view an S-VHS signal (50 Hz, I think) on an SC1224
monitor? I can't try because the plugs don't match, but if I knew it worked
I could perhaps get an adapter.

Thanks

Thomas Sahlin

>Go and read-up first.

Utter crap? They bought the name amiga. They are sticking it onto a machine(software? who knows) that isn't an amiga clone. It isn't a nextgen amiga. At best, it's another webTV, cause that's what they want it to be. As far as a crossplatform os, do we really need another? I can't see this doing anything that linux can't already do better in that arena. It has so little to do with the old hardware or software that it's a joke. They are in effect buying or trying to buy amiga fans by doing the PPC cards, so that they can muster of some kind of PR hype. They failed with me. Their "new" hardware is somehow even more apathetic than the PC, and they did this while still deciding to go with an uncommon cpu. They might as well contract out to those pc assembly places, slap the amiga name on some generic pIII box, and preload their "DE". Hell, maybe dual bootable like Be did for awhile. Hahahahahaha ha. Be. Sorry, have to laugh when I write that. Be was _SO_ close to doing what no other hardware manufacturer has ever done. And they threw it all away. How? "oh, the hardware isn't important, beos can run on macs, and there are plenty of powerful macs out there, pc's too!" Gimme a fucking break.

I'll take Milan vaporware any day over seeing the atari name whored out with as little dignity as they are doing with amiga. I understand that eventually there can be only one platform, that is the way of corporatism and capitalism. But I'll never comprehend how it managed to be the absolute worst one that clawed its way to the top.

All these people? I was under the impression that these were smallish companies. 20-30 people, all told. They aren't one product companies either, and I find it hard to believe that they are spending that much time developing. Everyone doing it fulltime would get it done in what? 6 months? Less?? Sure, I want people who do this to earn a good living... and $150-200 markup on such a card just for their profit couldn't be complained about. But it's something closer to 700+ markup. That's twisted.

>I built two IDE interfaces for my A500, and numerous other hacks.

True. Now, what if there were 20 other people clueful enough to provide help on such a card, all willing to devote significant time to it? For no other reason than to be able to get a cheap card done themselves? Split 20 ways, both time and resources starts to look less ridiculous. Maybe that particular hardware project won't work like that. I think it's just a bit too much to hope for. But something even a bit less complex might be doable under those circumstances. Think about all the development time spent on open source software. It must number in the billions of dollars. Still doesn't stop some from giving it away.

>Yes, but the cost lies in the development, not the individual components.

Supposing we do the development ourselves, the cost then becomes components and time. Not components and someone else's paid time.

4 layers minimum, probably even 6 minimum. Thats with kickass layout. Else you'd need 8 or more to do anything. 2 layers is possible to homebrew, so that $500 there is no way of getting out of. And no, its just the board. Automated assembly would be astronomical, dude. Please think before you speak. Please. Even paying someone else to hand solder it would cost $500+. Oh, and did I forget to mention that designing to allow for hand soldering increases the number of layers necessary?

>I may be crazy for trying to do what everyone here thinks is foolish or a

If you are absolutely serious, then start smaller. I read that you've bought an ST. I don't know as much about them as I'd like, but it seems there are many things you might want to build for it. Not as complex, concievably doable by one person. You'll need the practice, if nothing else.

Turing test specifies that the person have remote contact with anything "specific" to the 'computer'. Since it's in my personality that I want to understand everything on down to the tiniest component, no atari emulation could be hidden from me. I want to know what an atari does on the inside, and for me that's part of the experience. Emulators will always be pale shadows of the real thing, as far as I'm concerned.

Now, that doesn't mean that I consider 68k core emulation on a PPC, buried down in the hardware aspects of a machine, the same thing as UAE. It's not the same thing. If Jared were to magically acquire EE talent and show off a prototype PPC atari clone... I wouldn't jeer him "but its just an emulator!!! haha". To me, it would be an extension of what current atari's are.

I am a coder, and I will judge them. They write buggy bloaty code.

Now, this is hardly a crime, and in most cases still cost effective. Jared
should take that into consideration.

If you can get a s-video -> RGB splitter it would work. But the 1224 is
very dark so I don't know if I would recommend using it for video.

Source record: 55220

First of all, I apologise for the stupidly late reply.

A couple of years ago I was considering a similar thing, did a little bit of research on what was about that could complete and there was a large void just waiting to be filled! I didn't have the time to do much about it though and that is as far as it went.

If a new Atari computer were to be released, I would expect more than anything else for it to have an RJ45 network socket that I could connect it to my network with, to use my proxy etc.. etc.. this calls for TCP/IP and preferably 10/100 in terms of speed.

Personally I've got 2 STs so I dont see the need of it being backwards compatible with old ST software. I would expect it to be running some kind of dramatically redesigned TOS or UNIX based OS, possibly Linux!! Open source for most software but not high profile games or audio software. You need to make money somewhere!!

Now on to the hardware, perhaps a G3 as suggested above. Or do I hear Crusoe!?! hint hint. If the programs for it were written properly, then 32Mb of ram would be fine. I'm not greatly familiar with Yamaha audio chipsets, so can't really comment on that front. Graphics: I think you should look at other options rather than ATi. If you can get a sensible business plan and some funding then I'm sure there are certain graphics companies (I can think of two possibilities) who would be only too pleased to do a deal.

Quality of picture is more important than the 3D acceleration, to me at least! Hard drives don't seem to have been mentioned, 6Gb to 14Gb should be fine, if there is no software bloat, it will give huge amounts of space for files. A slot loading CD drive or possibly a DVD drive is necessary but I think with network connectivity we could do with out a floppy drive.

On to the case: now if I were to design the case for this I'd be looking for something apple cube esque. Certainly no fans, and much smaller than your average case. A flat panel monitor would also be nice but would probably be retailed separately from the "base unit", so that people can use there current monitors. Having the case wall-mountable would be a great selling feature too, I could put one in each room and not take up any floor space!

Please whatever you do ditch the idea of different office and home set-ups. Just have different models, not named after their target audience, would I buy a "home" computer now? no. never. I associate "home" computer equipment of today as being substandard to say the least.

Think small, light and modern.

These are just my opinions and others may find them completely opposite to what they'd like it to be. Though I think it will fail if you try to replace the PC, do something a bit different instead!

Good luck and I hope I've been of help.

Regards,

Aidan Barnett

Probably no longer available. This might have been 10 or more years ago. I read in this newsgroup that ICD is no longer supplying goods or taking a long time over it. I'm not even sure where the adaptor ended up.

Hi Ken,

Usually a shared scsi ID with different LUN is common for drives sharing
the same controller, and no I DON'T mean the host adaptor. All the scsi
drives I've seen have onboard electronics so usually the lun is 0 and a
different scsi id is used.

Ken Macdonald wrote:

From: James Alexander <jamesalexander@sprint.ca>
Message-ID: <3A00A6EC.C5CA3967@sprint.ca>
Source record: 55226

Well you didn't say what sort of lan you've got set up, if its using RJ-45 or bnc connectors it could be Ethernet (most common nowadays). Mario Becroft who posts here is releasing an ethernet adaptor. I found another one (forgot the url though) while surfing the net which uses a standard parralel port ethernet adaptor with a custom interface to the cartridge port on the ST

Hiya,
the supercharger ran on a NEC V30 processor which supported a few of the 286
instructions but not all. the manufacturers did produce the386 upgrade but
these upgrades are rare since most superchargers were bought and used in stock
condition.

Phantomm wrote:

5056. Re: Using an Atari SC1224 as S-VHS monitor?

Newsgroup: comp.sys.atari.st
Date: 2000-11-01 23:50:13 UTC
From: James Alexander <jamesalexander@sprint.ca>
Message-ID: <3A00AC34.6710D7FA@sprint.ca>
Source record: 55229

S-VHS is very similar to composite but with one importatn difference. S-vhs is 2 separate video signals, Chroma & Lumanance, which is separate intensity (B&W) information and colour information, some old 8bit computers had this running through 2 separate rca connectors. If anyone remembers the old commodore 1701/1702 monitors this is a similar idea..

Thomas Sahlin wrote:

$150 isn't to be scoffed at, and yes you're right...that would go a little
way in a hardware project, but add the source to GEM/TOS...lottery winners
only need apply, and then the numbers would be rigged against us...

Right from the outset the discussion as I saw it would have been vipers
nest territory, especially after the (predicted) blow with the loss of
Milan II. Jared might have considered that first, considering there was
actually quite some 'weight' shown in that project commercially. If that
failed then how could he expect a 'Smallfish Incorporated' effort to do

any better? He was politely told that his idea had some fundamental
problems but he dug his toes in against some of the most knowledgeable
Atari users around...that ultimately was his undoing...

Thats why the vipers nest got all 'hissy'...

> >...and as for the foulmouth in the bleachers...security remove
> >him!
>
> If they all have that keen, supersharp intelligence like you, I don't stand
> a chance! Oh wait...

Supersharp what? That cannot be me! I do however have 2 things...
1. Common sense (sortof)...
2. Enough history on similar previous projects to see that
any other new projects just will not be viable, as proven
by these previous efforts...

I think we'd better leave the stadium, the cleaners are trying
to sweep up since the game was over so long ago...and my
original score still stands!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Probably from ST-Computer.

>-MinTNet
>-STIK
>-IConnect
>-STiNG
>-Wensuite
>-Draconis
>Note that the above mentioned stacks are placed in order of being released.

Is that so? I thought Wensuite predated iConnect, and STiNG as well.

>MinTNet just like IConnect doesn't run under TOS, they both do need their
>own appropriate OS and clients. Way back in 1995 for someone using TOS or
>MagiC there was only STIK to consider. STIK couldn't handle PAP, and was
>limited to the SLIP protocol which at that time was being replaced by a lot
>of ISP for PAP.

So why not implement PAP but keep the API common?
IConnect is just like the original STiK, a stack dedicated to one particular
hardware layer and protocol.

>IConnect made PAP possible for MagiC users, it's always been very reliable
>and easy to setup... the same can be said of the clients. You'll probably
>disagree but there's not a lot out there that can standup to ASH Emailer,
>Teli, Chatter and Fiffi.

Never mind that. You've just mentioned all the clients available for IConnect.

>The IConnect clients are reliable, relatively bugfree and do the job. What
>more can one ask? they all share the same look & feel, handle the modern
>protocols (AV, D&D, GemScript etc...). The only client missing is ICQ, but
>that could very well be in the pipeline...

If ASH see it fit.

>>yet is incompatible with every one of them,
>Why should it be compatible with stacks that appeared later?

Or earlier. Two APIs are one two much, three is verging on the ridiculous.

>As an IConnect user I don't really care if it's compatible or not with other
>stacks, I like the clients, they work for me and I don't have to cry out for
>help unlike some people here everytime there's a new version of the "free"
>stack released. The clients belong among the best available on our platform,
>apart from Okami IMO there's nothing that comes even close... Someone using
>IConnect & clients doesn't really need to look further.

Your perspective is rather limited. Certainly there are slick clients, but a
limited choice, and lacking compatibility.

>I'm not really interested in the stack used, it's the clients which are
>important to me, if you're content with newsreaders that constantly loose
>threads& postings, buggy mailers etc... go ahead.

So why don't the superb ASH programs run with STiK, STiNG or MiNTnet?

>Instead of blaming ASH of using Microsoft tactics why don't you just admit
>that you don't like MagiC and commercial software? This is an attitude that
>not only you but a lot of people here share. Well, things are looking good,
>the way things are going right now commercial software will be complety gone
>in a couple of years... if you really think that the freeware and shareware
>market is going to fullfill all your dreams then you really need your head
>examined....

That's pure bollocks! I don't mind paying for software, but I despise business
methods relying on making public protocols proprietary.

>Oh... for the record, the difference between ASH and Microsoft is that ASH
>has always tried to release and publish quality software, while Microsoft
>specialises in releasing shit...

That argument is rather thin on the ground. ASH software is very slick,
granted, but also forms a system entirely of its own. You don't have much of a
choice. Id you want to run the emailer, you'll have to buy their stack, their
OS and the rest of the TCP/IP software as well.

>ASH doesn't only stand for MagiC, wonderfull programs like Texel, Artworx,
>Phoenix, Papillon, Signum, RSM, Jinnee...etc carry their logo as well.

And they still come up with some bad ideas, such as IConnect.

No, they used the MFM/RLL standard, which sux. The only Atari drive with SCSI in it was the Megafile 44, a Syquest drive in an Atari Megafile Box........Best way to go is get an ACSI-SCSI converter. This will run any SCSI drive of any ST...

The ACSI port is a ATari port which was useable for the ATari Laser
printers or adapted SCSI or other hard disk drives with the proper
adator like a ICD Link or other Atari ST SCSI host adaptor.

I've found that for smaller storage, the Syquest 135 drives
are small and work great on the Atari ST's by just adding the
ICD Link and using ICD Pro software.

- Last Updated 11/01/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision

To respond to this message, please use the enclosed address link rather than using your reply button

I have the following Atari ST monitors. All are cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NO.SPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Monitors Please make an offer
==========
- Atari SC1224 Monitor 13" ST Color Monitor - 2 units
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor - 3 units

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

5073. Atari ST Games Items for Sale/Trade

Newsgroup: comp.sys.atari.st

Last Updated 11/01/00
- Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply
- Atari SC1224 Monitor 13" ST Color Monitor - 2 units
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor - 3 units
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60 - with power supply
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - External 2400 baud modem with power supply

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf

- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

<derryck@NOSPAMcix.co.uk> grabbed chalk and scrawled:

>What would you consider to be a sensible price as a matter of interest?

It had been ï¿½150, I'd have snapped it up. I simply can't justify ï¿½200
for such a machine, but ï¿½150 is tolerable - I really rather want a
Falcon for the music freeware that seems to require the better screen
modes.

Richard (but it has to be in the original case and unmessed around
with).

>Sheffield, England.

Hi Pete,

I've said this later in the thread... I can't justify ï¿½200 on a computer
I'd use only for music, but I can stretch to ï¿½150 if you don't get any
more sensible offers. I noticed you haven't listed an HD there.

I'm assuming it's in the original Atari casing, and not recased?

Best Wishes,
Richard

You guys want to know what Atari's problem is?
Reluctant to change...

Look...
if DOS users are reluctant to change there would not be windows.
If Lotus 123 or Word Perfect user are reluctant to change, there will not be windows version of these program or similar.
If ppl are reluctant to change their 8 bit CPU, Intel will not be making 32bit CPU now or planning 64bit CPU.
Atari made the Falcon compatible with the old programs. Why? So that we can play (or try to) Dungeon Master on it? It can be more powerful with a 32MHz CPU instead of a slow 16MHZ CPU. They should have put that Jaguar processor in it and be the 1st 64bit PC!!!

Until now, I see that the hardware upgrades are still below 100MHz. Wow, the CT60 is a mere 66MHz... why ?? why not go 320MHz or more and access the old falcon hardware at 1/20 of the speed? Ppl are taking about 1.5 GHz CPU nowadays, and Atari users are happy with going above 60MHz. Faster hardware may be the way to recover users but there is also software requirements...

My falc chugs along slowly trying to decoding a MP3... while my P3 surf the web, plays MP3, plays 3D games etc without any problems at lightning speed.

Have a nice day....

Have a look at http://www.wbsystemtechnik.de/atari/in_e.htm

The Link97 advertised there is the most compatible of these. If I'm not
mistaken it's the only one that's still being sold.

Using a LINK97, which is fully compatible to the ICD Link, is a better choice anyway. In contrast to the ICD Link the LINK97 provides initiator identification. This is required in order to use certain Quantum Fireball drives as well as other SCSI peripherals that require the computer to have its own SCSI ID. The LINK97 reserves SCSI ID #7 for the ST/STE.

Hi William,

I fully agree... First I hoped for the Phenix, then had to reconsider.
Next comes the Milan 2. I didn't change my mind again, I bought a P3
too. Glad I did. Cheaper, faster, more s/w available.

IMO the problem with designers is the busspeed for the MB, Intel as
well as AMD have taken the first herd: going beyond 100 MHz.
It means redesigning the circuits. You simply can't go beyond 100
without redesigning the components.

Both AMD and Intel have plenty of customers. Initially the boards will
be expensive, but that's initially only.
Now enter any Atari clone designer. Has to do the same job for a
Motorola system. With few customers it won't be likely that the boards
ever will become cheap.
Enter the estimated prices for an extensive Phenix or Milan-2 system
(that's when they still intended to create them):
way above the regular Intel stuff. Those both didn't include boards
designed for speeds over 100 MHz. So go figure...

Now I hear people say: Motorola 60 MHz isn't the same as Intel 60 MHz.
True. But a stupid Celeron 600 on a 66 MHz bus also can't compete with
a 500 MHz P3 on a 133 bus. See the piccie?

Just add another nice day :-)

Um ... lest we forget that PCs have been compatible with each other
since the dawn of time. Certainly newer processors and, more
importantly, recent versions of Windows have divested themselves of
certain levels of DOS compatibility, but the entire reason the PC has
become as crippled as it is it because it maintains that legacy
compatibility. It's the reason the 640k barrier still exists. Intel
and Microsoft made the decision eons ago to retain compatibility so as
not to orphan their existing userbase when new processors and new
versions of DOS and, later, Windows came out. It's the reason OS/2
and the various flavours of Unix never became popular among mainstream
PC users: no compatibility. And when you have a machine that already
has loads of compatibility behind it, you're loathe to change to a
system that abandons that compatibility -- especially in cases like
the Falcon, where there's precious little software being developed for
it in the first place, and so scrapping existing compatibility would
be to doom it to failure right from the start, because little would
ever be made to run on it.

Atari was not reluctant to change. They abandoned the 8-bit
processors in '85 when they released the ST. And their 16- and 32-bit
line of computers remained backward compatible to the original STs --
to a degree. (Later TOS versions tended to break apps that weren't
well-behaved, which is to say programs that used tricks to achieve
particular goals)

>Until now, I see that the hardware upgrades are still below 100MHz. Wow, the

Precicely... and the requirement of software support will beat out
more horsepower any day of the week. What's the point of having a
blazing fast machine if you haven't got anything to run on it?

5087. Falcon Internet problem

Newsgroup: comp.sys.atari.st
Date: 2000-11-02 12:47:53 UTC
From: bonfieldd@my-deja.com
Message-ID: <8trnpo$u80$1@nnrp1.deja.com>
Source record: 55162

Hi. Has enyone experienced problems running internet s/w on the 4Meg Falcon? I've tried Wensuite, Cab & Draconis with similar results - them crashing, coming up with 'Error 69' with Magic. This happens constantly, especially with Cab & Draconis. Any ideas??? Also, when Wensuite doesn't crash it just will not load some websites, Google.com, Yahoo.com or even the OXO homepage being just a few examples. It just gets stuck on 'Resolving DNS'. Cab & Draconis have no such problem. Again, can anyone help???

Thanks in advance

Denis

5088. Re: Afterburner problems.

Newsgroup: comp.sys.atari.st
Date: 2000-11-02 13:37:08 UTC
From: Jonas Klereborn <klere@physto.se>
Message-ID: <3A016E04.AB8C40B4@physto.se>
Source record: 55163

Mike wrote:

> When I have had problems like this in the past, it was almost always a
> problem with the clock patch somewhere.

I have looked at the signals and they look rather fine. I have also
checked for cold solderings.

> Do you use a resistor near the DMA connection?

No. Do you mean near where the clock is entering the DMA chip? Should I
perhaps cut the clock trace and put a resistor before the input pin? 33
ohm or something? I checked the signal on the DMU clk pin with a scope
and it looks nice. At the patch is looks a little strange though. The
rise and fall slopes are a little jerky. A resistor at the DMU chip
might reduce signal bounces?

> Somewhere there is a bad clock it sounds like.

That's my first guess as well.

One thing that is strange is that the 68030 works perfect every time
without the Afterburner mounted but as soon as I mount it the 68030
starts to fail booting. So somehow the AB card disturbes the 030 during
booting. (If it passes the booting face it works perfect all the time).

In addition I looked at some signals on the expansion connector (J16)
when trying to boot the 68040. I seems that the RXW signal i toggling at
power up. Trying to send a reset to som part of the system? It then
stops (beeing high) when the rom is read (or something like that)? The
problem is if I look at the last low section it looks to short.
Corresponding well with the fact that the fuji logo is only half
displayed. Maybe this can give a clue of what's wrong. Sometimes the
computer keeps reseting over and over by itself a few times. The RXW pin
is then toggling at the same frequency as the resetings. To me this
indicates either a bad clock or a problem with the one or more reset
signals.
Anyone knows how the reset procedure is in a falcon (with AB)?

In what way could the Afterburnar card influence the 68030 when the
68040 is inactivated?

Regards and thanks to anyone that has spent time with this problem so
far,
/Jonas

5089. Upgrading a C-Lab Falcon

Computers of the '70s could be built by
amateurs/hobbyists with basic tools. Today's
computers rely on very high precision
manufacturing processes.

Why do we need "more speed" to begin with? Why not just run the stuff we have because it is unique to our platform? Atari is good for IT's thing. If you need fast Internet speed and MP3 plyability, get a Mac/PC for that.

Use the Atari for what it was intended for: Unique software especially in the Midi area....and the GAMES. Missile Command anyone?

>What suprised me was he replied at all.

Guess I can't understand why he or anyone else would worry about
whether it was feasible or not. Just release the internal data;
if MiNTers find it interesting, THEY will do the porting with
no additional effort on the part of Amiga Inc., Eyetech, or any
other Amiga-related outfit. It can't do anything but improve their
sales; heck, if some Linux people got interested (which certainly
some would), and had enough info on the AmigaOne internals, Eyetech
would be that much better off!

It doesn't seem to make sense anymore to keep hardware "secret".
I can't imagine there being enough capable hardware operations who
could "hijack" the PPC AmigaOne design and who would think it
economically advantageous to do so. In fact, I'm not sure we
SHOULD be interested in a closed architecture owned by another
company with very little interest in Atari. It's been bad enough
with companies that ARE associated with Atari! Including Atari
itself!

As far as counting ST owners, I thought there had been efforts in
the recent past of doing just that. Create a database to screen out
duplicates, advertise on comp.sys.atari.* and maybe a few other places
(prominent web sites) asking for email, and count the responses. Of
course, you only count the Atarians who are internet-capable, and I'd
be willing to bet most are not.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To make room for new stock, Bravo Sierra Computers is holding a YearEnd
Holiday Sale. Everything is 10%-30% off! Atari Orders for $50 and up
are 10% off, Orders $100 and up are 20% off and orders $150 and up are
30% off provided the customer claims the discount in E-Mail. This Sale
covers Atari Jaguar, 8-Bit & ST. This Sale does not cover Monitors.
Customer pays Shipping. So order now while supplies last. Get your free
Atari catalogs at: www.atari.benjamin.net or E-Mail atari@benjamin.net

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

This is exactly the premise behind the Open Hardware initiatives, including
the PowerPC Open Platform one. It is especially nice when a big company
like IBM helps you out A LOT by releasing a pre-designed PowerPC
motherboard to the world, with just a few GPL-like restrictions.

You can use IDE anyway, there is a 44w (laptop) IDE connector on the Falcon motherboard, I do a kit to convert to 3.5", and it will fit (just) inside the shield with no mods to the shield, just the disk bracket.....and you'll have to solder a drive PSU connector to the power supply of the Falc......recasing....how big does it need to be, yuou might be well served by a Lighthouse tower or a Desktopper, but they are a bit limited, or else do what I did and throw the whole lot in a big old AT desktop....lots of metalbashing involved but gives a useful result....The only available lo-end accelerator ATM is the Phantom, you might still find a CT2 if you looked hard enough, otherwise pre-order a CT60 or wait to see if the Tempest makes it out.....given that the Eclipse graphics card was late (available just about ATM AFAIK) the Tempest will be later than hoped but will prolly make it out sometime....

Drives....do the 3.5" trick and you can run a 6Gb hard-drive and an IDE CDRW (you will need HD-Driver and some good software for the CDRW though)....Eclipse handles huge monitors (I run mine at 1280x1024 at 16bit on a 21" screen), and handliy Phantom SE comes with a 44kHz clock that fits internally that helps MP3 playback no end....

Perhaps, but how are you getting at the figure of $300 for components?. One
of the support chips required for the PPC interface on Amiga accellerators
costs $40 a piece in bulk. That's just one lousy support chip...

> fucking break.

I've been all over the amiga news since about the time phase5
went under and I have to agree here... it appears the name
is the most important thing here. The machines look generic and
completely unrelated to the old machines. I think phase5
had better machine designs, but never got one out the door.
Apparently they intend to provide some sort of classic emulation,
but the scope of that is a bit unclear atm. My neighbor cannot
handle any negative comments whatsoever about the situation.
In fact anything I say that appears negative is resonded to
with... "but they intend to release the new OS for my PPC
upgraded old amiga". It's only a matter of time before that
cobbled together mess of cards and drivers can't keep up.
Then this new company probably has you by the.... or you
get a pc or mac.

Anyway, in case anyone was wondering what I asked Fleecy.
One day whilst in my confusion over how to solve some of my
limitions on my own desk I thought perhaps atari and amiga
could unite on one platform. And since they already had
PPC support and that is the direction I'd like Atari to
go if it must progress... I wrote Fleecy an mail asking
if amiga could provide classic Atari emulation and openly
support Atari.

Maybe a good idea, maybe a bad idea.... needless to say
I did ask. lol

>itself!

I agree. To be honest, I still don't understand why the open source concept can't apply to software. Why don't we come up with our own architecture instead?

Whether they believe it or not, everyone here has some help they could offer on such a thing. Help that doesn't mean much of their time, or any of their money. If nothing else, just arriving at some kind of consensus on what the new atari would have to be, would be a start. People are asking the wrong questions now, technical nitpicking is unnecessary at this point, so are budgetary considerations. Until we know what must be on such a board, and price ranges are just wild-assed guesses.

What kind of slots should this thing have? PCI likely, but maybe in addition some legacy atari slot?

How much and what should go on the mainboard? Should there be onboard scsi, or ide? Should video be onboard, or only through a slot? How much ram should we socket for?

How bout less important "livable without" peripheals? Ethernet, serial ports, parallel ports...etc. I'm not familiar with atari computers... but maybe even some atari cartidge port for the hell of it (this would be minimal cost, except possibly for complicating the layout) ?

Should board layout be designed so that the mb will fit in a generic pc case? Should we even worry about the case, or should we look into getting custom faceplates and/or custom moldings made? Perhaps with some neotari logo? Could we even call it neotari without incurring the wrath of rabid flesh-eating corporate lawyers?

These are the questions Jared should have asked.
Here are some of the ones I can answer

PCI 'might' be doable, and even I must admit that it would be the most practical. Stay away from agp, specially since there is still alot of video performance to be wrestled from pci. I've read here that some atari models

went with VME slots (are these standard, or atari customized?) and yet others went with processor direct slots. The pds slots would be pointless, unless there is some demanding need, perhaps some kickass card that everyone has. But maybe a single vme port, for backward compatibility?

IDE is the natural choice. If someone truly wants scsi, use an expansion slot. Video on board could complicate things, perhaps unnecessarily. If we have pci onboard... why not a cheapy pci vid card instead? We'd want to go with 72pin simm sockets I believe, and if we put 4 on and designed them to see 16meg simms, that would have nough power for most. By the time it was finished, 72pinners will be gone from retail, but exceedingly cheap used. Then again, maybe only DIMM would be enough.
Could put only one dimm socket, and still design foor buttloads of memory.

Single serial port, yes. IEEE 12?? whatever parallel port, yes. PS2 mouse and keyboard ports are the easiest, but maybe we could try for usb? For me, I think it a crime to even contemplate not giving this ethernet onboard, but there are advantages to leaving it off. We could really only afford 10baseT, but if we have PCI, even 100baseT is doable (then again, who said dual network ports would be bad?). Sound of course could be onboard, and if we only do 3 or 4 pci slots, then we don't want to leave the motherboard too barren. Pick a chipset, there are enough "sb awe32" class sound chipsets to choose from. Joystick ports are a must, no idea which standard though. PC style, or maybe some atari legacy joystick port? If we go with usb, this too could be moot.

We can't get our own cases made. That's ludicrous. But depending on whether we wanted to be stuck with a single generic case or not, maybe it's not out of the question to have the plastic faceplates replaced with something custom. Need to do more research, but for $25 wouldn't it be worth it to make it look less like some piece of PC junk? Maybe it wouldn't be the ST case that Jared is horny for, but if we could borrow some of it's style, maybe we'd want that.

Just some thoughts,
John

Doesn't sound like you have a Nemesis installed. Does the existing clock
patch run it's own wire to the DMA clock in? That's the best way,
keeping the wire well routed around CMOS and RAM stuff. Cut the DMA
trace a little after it dog legs around the beed, scrape a little clear
off and make your connection there. At that point is where the AB likes
a resistor tied to ground. Value varies between machines. I don't have
the instructions handy ATM, but will post the recommended value soon.
Some users (myself included) install a pot to make fine tuning easier.
Do you have an FPU installed?

I seen something like this while trying to emulate the MI signal from
the 040 trying to adapt an 060. I don't recall the RXW (would have to
look at notes), but some of the signals that should have been pulled low
seemed to float a bit. I didn't notice any problems from it however.
Will look at the boot sequence in the manual.

5108. Newsie problem?

Newsgroup: comp.sys.atari.st
Date: 2000-11-02 19:48:45 UTC
From: vdjole@EUnet.yu
Message-ID: <8tsget$j55$1@SOLAIR2.EUnet.yu>
Source record: 55189

Hi;

Seems that there I noticed a problem with Newsie V0.961- when an e-mail (or a news post) that is queued for sending is re-entered for editing, Newsie does not correctly update the number of lines (message size) in OUTBOX.MBX. So, if the message gets longer by re-editing, after that Newsie won't show it completely in a window- it can be scrolled only as far as the original size. I checked the .MBX file and indeed the number of lines there is wrong.

Anybody had some experience or remedy on this?

Maybe, but this would have been discovered very quickly so they wouldn't
actually have done such a thing.

> How would you like it if somone made a clone of something of yours and then
> went ahead and made a profit from it.

If I handed out the source for free and told everybody to do whatever they
like with it, that would be fine for me. And MiNT-Net is IIRC under the
GPL-license, so ASH could perfectly well have ported it (instead of just
implementing a new stack with a compatible APIP) and sold it for profit as
long as they also released their diffs under the GPL.

> between S-VHS and composite video?

S-video has separate chroma (colour) and luma (intensity) signals, in
composite these are mixed (hence the name). I believe s-video has the sync
on the luma signal, but I could be wrong. The SC1224 requires separate RGB
and syncs.

>
> But do you really need 50 tracks!!

You never know... ;)
For the moment, I have no use of that many tracks - but I mostly have need of more than the 8 I could get with CAF - and I'm not interested in using the compressed audio option to get 16 audio tracks in CAF - I want to be able to record in 24 or 32bit - the Falcon is a maximum of a mere 16 bits, which is ok for very many, but as I do mastering for some people besides myself, I need the better resolution provided by VST and my soundcard, to keep a better S/N ratio and dynamics until the end, when the master has to be dithered to 16bit to fit on a standard audio CD...

> >sample-accurate sync - and as many midi tracks I'll ever need - also with

> support ASIO 2)

Sample accurate sync with CAF? NO WAY!
If you replay 8 simultaneous audio tracks with the same content on the Falcon, you'll get a chorus- or flanger-like effect. This means you don't have a perfect sync. If I replay 50 simultaneous audio tracks with the same content with my PC system, there simply isn't ANY difference to replaying just one of the tracks - it's just a bit louder, but NO side-effects

whatsoever :))
Midi in itself is inaccurate, of course - so there is actually no midi system that's perfect. A transfer speed of 31kbaud isn't fast...
How people can speak about Atari having better midi sync than PC, I'll never understand. I haven't heard proof of that yet (other than with cheap games-soundcards which are unsuitable for anothing but games).

> My Falcon has a working Afterburner 040 and Nemesis installed by Titan
> and shipped back to me in the US with no problems. Charlie S. even tried
> a quick code change with some 040 tips from Doug of Black Scorpion fame
> but it never really worked (tried to get CAF to use FAST ram for audio)
> but this is a whole different story.

CAF wasn't designed to run on a 040, so that's no surprise at all... CAF could be loaded into the Fast RAM of the F/X-card however - and it became somewhat faster, but not enough for what I needed. Nemesis accellerated CAF a bit on the machines where it worked - the other machines just locked up when trying to run CAF :(It might have been a help if Steinberg released the source code, oso it could be re-compiled for 040 - but that's out of my field, so I'm not getting into developing that thread...
Since music has always been my first priority, the main reason why I never got one of the clones is that they were never able to be compatible with CAF - otherwise I wouldn't have doubted - but eventually, I wouldn't have had any choise anyway, because of the 96/32 possibilities and better software availability and more professional software tools to choose from.

If I painted my TT gold... it meets or exceeds some of those specs and
it's already a collectors item.

> But we'll never know, will we?

Maybe, maybe not. I ordered a hades because I need some features
rigth _now_ not a year from now or 2 years or whatever time it would take
for some new machine to be developed. If I have to spell it out... that
means I'm still holding out, sticking with it. Hoping for something
more to come along later perhaps. The only flaw in your plan seems
to come down to funding, even if your specs may be strange to some
you can't fund it, and that is asking alot from mere users.

I shelled out far more than 150 buck for a hades, something that is
obtainable... you are asking people to shell out money for something
most see as a risk.

You can preach all day how no one cares, but you are just plain
wrong. Caring is one thing, funding is another, or donating time
when most everyone has full time jobs.

> And all because no one is willing to help try to make it happen... because
> everyone believes it just can't be done.

I think it can be done, but not funded by mere users on usenet.

> This will be my last post/reply on this subject. I've got my life to live

I don't see the basic difference between what Jared proposes and what the Hades and Milan do: it's a clone. Only real difference is a PPC so it will have to emulate a 68k for backwards compatibility. It's Jared and you who have a problem with emulation, not me...

As for clues, it's Jared and you who can't seem to get a grip on the idea that you are effectively proposing a Milan (but less well thought out) with an emulated 68k processor with yet another OS variant (as if there isn't enough of a problem with MagiC and MiNT fundies having wars). I emphasise the emulated 68k as the chances of anyone producing new commercial software to run native on PPC is about nil, as you would appreciate if you had any kind of grip on reality. The market is too small - any commercial software has to run on everything from an ST up to sell enough copies.

> >Neither. MagiCMac/MagiC-PC would do the same thing for less and give

> one platform, the world over. You're not saying, "sorry count me out",
> you're saying "others shouldn't WASTE their money on anything but a
pc".

I really object to you telling me what I think and what I am saying. Try reading the question and the context. Jared asks if would buy one of two choices: I would buy neither because I don't regard either as good value. Everything else is your invention. I am speaking for myself, not anyone else. I do not advocate PCs in this group: if I felt the need (I don't) I would take it to c.s.a.advocacy. I am not in favour of only one platform (even in the above statement I manage to mention two on which to run Atari software), I am in favour of people using what they like. But in the real world the chances of Jared's proposal succeeding where Milan has failed is nil. It's more of the same but with a lot of idealistic shouting tacked on, IMHO.

> Think about it for a moment. Even if I wouldn't/couldn't get one
myself, I'd
> be happy to see a new PPC atari clone built.

Whoop di doo: we know that. Jared asked a set of questions to which I gave straight answers. If he wants to go ahead in the teeth of the general consensus of opinion here, I wish him well. But this is his core market - if he can't sell the idea to people in c.s.a.s he won't be selling many units to anyone else.

All I know about it is: a Povray rendering on my TT took 23 hours.
On a deadcheap Celeron 400 MHz it took less then 1 hour.
Sorry.

Everyone on the atari market. Most workstatione and some PCs require parity.

>>If the SIMMs are broken, bring them back to your dealer.
>
>I'd really like to see what they would say if I brought back to them a SIMM
>which worked fine in all of their machines due to it malfunctioning in a PS/2 or
>Atari.

I did that multiple times - if it's broken, they get it back, no matter if
it will work in *some* machines. Same goes for partially defective or
unsuitable (3.3V) SIMMs, which also "work" in some machines.

Hello all!

I have the following for auction:

Mega 4 STe
Has all original manuals and boxes. Works great! I just need to make
room in the wallet for the G4!

Check it out: http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=488575383

I also have an SC1224 in the box with docs. Also works great!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=488579289

Thanks

-Marlin

>Why doesn't any one mention DA's LayoutTC any more.

I'd suggest that it's because the only way to buy it in the UK is
through Cortex - and there was something about the key file IIRC.
You'd be better placed to firm that out.

My personal experience with the demo versions was that it would crash
if I tried to change a CFN font to DA's Layout's format. I mentioned
this to Titan (as it was then), but there was no satisfactory
outcome. I put it down to its demo nature, but wasn't willing to back
that up with money!

Overall it's easier to use, perhaps better as a single or double page
flyer designer than multi-page docs where Calamus would score.

Is it still possible to get this program in the UK?

Hei all.
Is there any development on when German Atari Show will be.
If so whats the best way of going there.

regards

I believe the entirety of Atarian history of today can be summed up as follows:

Atari died. Support died.

I tried to offer hope by saying:

Atari returns. Support returns.

Regardless of who would buy an Atari system and who would care, the very fact that Atari was back would surely turn some heads. And, with the path of upgrade I outlined, from 603e to G3 to G4 (and whatever else is beyond, including the possibility of dual CPU systems early on), as long as Atari was showing the world that "We're back and we're the ONLY other company selling PowerPC-based, consumer-grade systems.", there would be hope for a revival.

The reason support is nigh dead now is because no matter how much effort you put into "keeping the spirit alive", you will ultimately fail, because the flag holder (Atari) is dead. No follower or clone maker can produce a clone and sell it as successfully because the only buyers will be the ones who are already in the camp. And the camp is slowly but surely closing down. Day by day.

People don't seem to realize tht the name "Atari" IS worth more than they think. Even for people who think of just old game systems, Atari is still in their minds. And "mindshare" helps sell systems.

As I figure it, with Atari back on the warpath, TOS/GEM could not only be brought back into usage, it could then be ported and enhanced beyond even the TT/Falcon030 version!

But the 68K lifespan is nigh at it's end. We jump tracks (to PowerPC... significantly more powerful, multiprocessor-capable, and an extended lifespan several (if not many) more years down the road), and bring back the systems! Old design first and then new ones after. The old designs help the Atari literate public and past Atarians get excited again, that Atari IS back and back with a vengeance!

How many Atari clone manufacturers do we have? Who is still selling systems with an outlined path of systems for the future? See my point? When the source of the campfire is extinguished, where does the fire go? Atari WAS t he source.

The reason (source) for TOS/GEM etc. is dead. How much longer do you think anyone can keep it on life support? I dare say not much longer. Only by bringing Atari back can we bring the spirit back. If there had been no

Atari, would there be clones now? If Atari had NOT been saved by the Tramiels, would Atari clones exist today? Eventually, even if the clone effort continues, eventually they will be so non-recognizable as Atari clones, they might as well not be called clones at all. We have taken TOS/GEM and either mutated it or patched to it so far, that we might as well abandon it altogether. Would MiNT exist without TOS/GEM? No. Would MagiC? No. These two would not exist today had it not been for Atari and TOS/GEM on the Atari ST. We need to remember what we owe tribute to and help bring it back, in gratitude! Because, without the source of the campfire, the fire vanishes.

Atari could, in all likelihood, sell backwards compatible systems to the few or many who would buy them and help revive the market for them, especially being the only other computer maker of [home] PowerPC systems.

1) Nostalgians would buy some (can you imagine a special, limited-edition classic ST decked out in gold (or silver or platinum) colored plastic, with 16Mbytes of RAM, the Blitter chip, 640x480x256 color resolution capability, etc.? Talk about a collector's item! I'd buy one in a heartbeat!)
2) Atari-brand loyalists would buy some (same as above and new systems, too!).
3) New people who suddenly took notice of this new Atari and it's systems, would buy some (probably only the new systems).

To say no one would buy these new systems or care that Atari was back (or care about the name, period) are simply speaking from their own perspective. Yes, it would be a massive undertaking, both technologically and financially. Yes, it *wouldn't* be an overnight success. But...

If you stick yourself in people's faces long enough and give them something to look at that says "this is what we sell and this is where we're going", people are going to take notice. And some will buy and some will not. But that's the way it is with any company/business selling a product.

But I would almost be willing to stake my life on my belief that Atari, if it came back, would be successful... sooner or later. And probably no less than it was during it's peak, if not more.

But we'll never know, will we?

And all because no one is willing to help try to make it happen... because everyone believes it just can't be done.

This will be my last post/reply on this subject. I've got my life to live and other dreams, more achievable, to attain. It's a shame so few care about the company that gave them their systems and/or the reason that their clone systems even exist today. If I had a reason to own an Atari, I would.

Jared

Thanks, I didnt want to have to type all that out:-). I am changing things all the time. But the Pentium 3 is still bassed on 8 bit architecture. Why invest in shit that cannot run reliably? My PC play's games as does my N64 and I certainly dont trust it. And I build them for a living (not to say I dont know what Im doing of course). The only real thing strangling the PC is their crappy backwards compatibility. At least Atari ditched Dos 2.5 etc in favour of TOS/GEM, and I thank them for it. My Falcon is rock solid it takes clumsy feet and big hands to kill it.....

Oh come on... there is Missile Command on almost any platform, including the BBC micro and the dreaded all-powerful Wintel. What so unique about it? (nothing unique except that Atari's is on that low res screen, but hey! you can see that bigger sprite easier than on a 1024x768 screen).

I heard that the Atari MIDI implementation cannot keep the correct timing. So that's the unique thing about it.
But hey, there was an TV advertisement which had the some effects/music done on a STE, it was done by a member of our local Atari enthusiast club. Sadly, that was way back in 1990.

Have you played Age of Empire II lately.... from the Evil Empire?
or installed StarShip Trooper?

Mmm.... so it seems you don't game on your Atari.
I agree that if you want to play game, on your N64 or go queue at the PS2
line. They are much better, afterall they ARE games machine.

There seems to be not much problem for me using the PC, therefore I find it
quite reliable. Of course, it's probably because I am an Atari user, who knows
how to beat sh*t out of a system.

>dont know what Im doing of course). The only real thing strangling the PC is

Win95 is DOS compatible, but then since when do you still use DOS? All the
stuff I have are Windows version. Now I am on WinMe, finally they took away
DOS. But I need to have DOS back.... Argggh... so I type COMMAND and ... lo &
behold there was DOS prompt! Saved at last.... Yes, they still carry that DOS
shit around.

What Atari needs is to more forward with faster system, so that the software
can do more.... don't that sound like micocrap shouting at intel eons ago?

Now don't get me wrong, I've came into computers as a hobby far too late to know anything more than rumors about the flamewars of "amiga vs. atari" and I must say that I am an amiga fan (but no less an atari fan because of it). I think there are far too few platforms left, and I don't want to see them merge. Choice, uniqueness, idiosyncrasies... these are all gone in favor of the wasteland we call the wintel hegemony. I don't want to see atari turn into a pc either, or be reduced to an emulator running on a pc. That sentiment and a billion dollars, and things might change. Oh well.

That's because the OS support it as a sub-OS, or an partitioned part of the
OS.

>compatibility. It's the reason the 640k barrier still exists. Intel
>and Microsoft made the decision eons ago to retain compatibility so as

640K barrier.... there are programs which loads 2MB of data, and also some
of that horrible DLL are 900KB large. Now they will surely not load into 640K,
no? But somehow, they do.... is it black magic??

>versions of DOS and, later, Windows came out. It's the reason OS/2
>and the various flavours of Unix never became popular among mainstream
>PC users: no compatibility. And when you have a machine that already

Er... that's because Unix was not pre-installed on PC.
On my first 486 @20MHz, 512K ram, it would be kind of difficult to run, but
hey, Zenix was scrapped by MicroShit which suppose to run on a 386. DOS would
run better & easier on a PC. And all PC hardware manufacturer should not want
their customers to have a hard time using that PC junk at home.

In all major industrial company, OS2 & Unix was the norm for high volume work.
That DOS shit will not be able to handle all the network connections, file
access etc. I still remember that Windows for Workgroup 3.11 was so shitty
that it hang for a minute or so, when it is sharing the printer.

Then the day came when IBM shutdown OS2 support, when NT was so much cheaper
to get. So all the industry big boys have no choice but to try NT.

>
>Atari was not reluctant to change. They abandoned the 8-bit
>processors in '85 when they released the ST. And their 16- and 32-bit

True, but they need another major change on the computer line ... which never
came. Instead the change was to stop it & just move forward with the jag.

>
>Precicely... and the requirement of software support will beat out
>more horsepower any day of the week. What's the point of having a
>blazing fast machine if you haven't got anything to run on it?

I am sure if they hardware was powerful, we can easily port some programs like
Java engine etc... then we can all run StarOffice from Oracle and never need

to have MicroSlop Office. I was developing some apps for my falc, but the limitation of the hardware speed just shut down my projects. I get the software ported from unix/windows, but it was too slow to work, an example is I have to wait 2-3 minutes to decode a 5 secs media data - waste of time & effort.

ciao.

Dude, not even close. First off, you said hey maybe atari "can" return. BIG DIFFERENCE. Support returns? You definitely need to think about this. You could sooner build the damn ppc clone than you could "support" it. You claim to work with computers? Support is a all-consuming black hole of despair and talent on the pc platform, and there is more expertise in that, than all the other platforms combined, server, workstation, and consumer computers combined.

Dude, there is so much more to it than picking out your favorite cpu. So much more. I don't know the answers, and I know damn few of the questions, really. You don't seem to realize any of this. Dual? Why don't we throw in a complete NUMA architecture, and socket it for 4 gigs of ram? No company could do this. Even I have to agree with everyone on that. If Borg Gates himself decided that he would repent, and spend his vast fortunes redoing the nextgen atari, and Larry Ellison decided to go in too, just MAYBE it could have limited commercial success and break even. Maybe. But probably not. How many times have I said that there may be a way to go about it, but it would't be a commercial hardware company. Say it with me, hell spell it out. N-O-T -- A -- C-O-M-M-E-R-C-I-A-L -- C-O-M-P-A-N-Y.

This isn't a religion. A hobby sure. An obsession maybe. We don't have to convert people, and we couldn't if we tried. And since you could more easily talk Fort Knox into giving over its gold than you could persuade Whoever-The-Hell-Owns-Atari to license the name, it will have to be a clone. There is precedent for clones becoming the standard (the PC), or barring that, for them being preferable to the original manufacturer (the Mac), I don't see why you have a hair up your butt worrying about it.

>People don't seem to realize tht the name "Atari" IS worth more than they

Funny, but #1 and #2 are the same people. #3 buys whatever the marketing
brainwashers tell them to. We can't afford marketing brainwashers.

>To say no one would buy these new systems or care that Atari was back (or

Dude. You've given nothing but rhetoric. You've given inane questions and
answered them yourself without conferring with us. I can be forgiving, but
haven't I already politely tried to point this out? I give you advice, and 4
posts later it reappears in a bungled half-assed format, as your "research".
Usually you get my best guestimates so wrong, that if anyone associated them
with me, then I'm truly embarrased. Do you even know how to go about getting
a quote for pcb's? I'm signed up with over 20 pcb fab websites, and I'm
getting various quotes from them on a daily basis. I have some clue as to

how much they gouge for 1-3 qty prototype pcb's... and I also have called and spoken in person to at least as many. If I asked them if their prices included "soldering on the parts", they would literally laugh at me.

>But I would almost be willing to stake my life on my belief that Atari, if >it came back, would be successful... sooner or later. And probably no less >than it was during it's peak, if not more.

Successful at making an interesting computer? I wouldn't stake my life on it, but I'd bet $500 they would. Successful in a business sense of the word? Haha. This must be a joke. I wouldn't stake 50 cents on that, and someone that would wager their life on it has a death wish.

>But we'll never know, will we?

Not the way you are poisoning people's attitude toward such an idea.

>And all because no one is willing to help try to make it happen... because >everyone believes it just can't be done.

Not the way you seem to have made up your mind to it.

>This will be my last post/reply on this subject. I've got my life to live >and other dreams, more achievable, to attain. It's a shame so few care >about the company that gave them their systems and/or the reason that their >clone systems even exist today. If I had a reason to own an Atari, I would.

We never cared about the company. Some rape victims care about and love the children that they had because of it, but they never ever have warm fuzzy feelings about their violators. This situation isn't that extreme, but the same principle applies.

Will this work?

1/ Get a PC motherboard and a non-intel CPU, some memory, HDD....
(oh damn, or get a PC without any intel stuff in it.)
2/ Load FreeDOS as a preloader.
3/ Load in the best Atari emulator we can get our hands on.

Hey Presto.... a new & fast(see note1 below) Atari ST compatible computer.

If we can load the network drivers on that FreeDOS, and there is somesort of the "bridge" program on the emulator, then we can also access the network ethernet. Add that CDROM hardware support or even DVD hardware player support on the emulator, we can ask Aniplayer to decode DVD as well.

Now if anyone want to try this......

p.s. I only provide the idea.

note 1: fast = depends on the CPU class, if an AMD athlon class then it should be fast.

Ok, lets start this, then :) I'm no hardware expert, but here are my
thoughts on a "NextGenAtari" board;

Such a motherboard would only contain the absolutely necessary things
needed in on a host board. This would be CPU, north/south bridges, memory
slots, etc. No sound, no gfx, no nothing onboard. This would keep the cost
down (would it?), and we could make this part, the foundation, GOOD and
FAST.

For everything else, lets use PCI/AGP/ISA slots. And we could also
include one or two ISA slots, because there exists already a RopoCop card
that gives you 3 Atari Cartridge ports.

Now, since we don't include anything on the board, we could let it have 6
PCI ports and perhaps 2 AGP ports. This would make it very expandable.

Minimum 6 PCI slots, 32-bits 33Mhz
This would provide all we need, even USB ports for those who want it.
There are USB PCI cards, etc. Also, ethernet, serial ports, even SCSII
cards, etc..

2 or 3 PCI slots, 64-bits 66Mhz
Just so we have them too.. :)

2 AGP slots
Graphics cards, ofcourse.

1 or perhaps 2 ISA slots, on which a RopoCop gives us Atari Cartridge ports, if necessary.

Atari legacy port... hmm. How about 1 ISA and 1 VME slot?

This would make up a board with 6/3 PCI slots, 2 AGP slots, 1 ISA and 1 VME slot. It must be cheaper to go this route rather than trying to incorporate stuff onto the board? I also imagine that this will enable us to make the foundation good and fast, i.e., use the best for the motherboard.

> IDE is the natural choice. If someone truly wants scsi, use an expansion

Just about the only thing that should be onboard

Ok, the above might be overkill, but I think it is better to use slots rather than incorporate stuff onto the mainboard.

Next?

Yes, it could work.

>Hey Presto.... a new & fast(see note1 below) Atari ST compatible computer.

No, a dedicated atari emulator. Big diff.

>If we can load the network drivers on that FreeDOS, and there is somesort

Dos packet drivers are a genuine pain in the ass. Supposing they would work with freedos well enough, the software would be possible. Cd support shouldn't be too hairy, freedos does well enough with mscdex or even the corel version. DVD won't be possible. You'd be better off with linux.

>Now if anyone want to try this......

Not really. I like computers, and I already have a pc. Atari's are nice, but the "pretend" versions don't cut it.

>p.s. I only provide the idea.

Hmm. Tell you what. I'm not being mean, and just because I don't like it, doesn't mean you shouldn't do it. Feel free to ask advice on the pc aspect of it, and I'll help if I can. If there are no linux emulators available, the next best bet would be to use win98's "dos". You'll have the best compatibility for the few dos packet drivers left, and the other various dos utilities that might be needed. Creative batch scripting and a simple dos EXE, and you could even fake a nice atari splash screen. Get a nice bios, and even the post test could be hidden...

If this is acceptable to most, then this is indeed a very economical design philosophy.

> For everything else, lets use PCI/AGP/ISA slots. And we could also
>include one or two ISA slots, because there exists already a RopoCop card
>that gives you 3 Atari Cartridge ports.

PCI is hardly easy, but I felt anything else would just not be anything anyone wanted. Even I have to admit that the sheer number of generic pci cards makes this attractive. AGP is another thing altogether though. Even if we managed to get it working, we'd never take advantage of it.

> Now, since we don't include anything on the board, we could let it have 6
>PCI ports and perhaps 2 AGP ports. This would make it very expandable.

Heh. I've wanted a dual agp motherboard for the pc for months now. Even others haven't managed that one. But if you're gonna dream, I guess you should dream big. Maybe 1 agp if you get me drunk first.

> Minimum 6 PCI slots, 32-bits 33Mhz
> This would provide all we need, even USB ports for those who want it.
> There are USB PCI cards, etc. Also, ethernet, serial ports, even SCSII
> cards, etc..

6 pci slots is pushing it. The only reason at all I can't say nasty things about this is that you have stated that a SIMPLE motherboard is what you'd want. That makes up for alot. Also, even a pci slot will only need 2 layers on the motherboard. Maybe the motherboard could really be a 2 layer... making homebrew prototyping possible. The ugly cpu part of the motherboard is a problem, I don't see anyone but a pro doing it in less than 8 layers. Concievably it could be done in 6. I haven't looked into what kind of schematics this might entail. Now, if that portion of the board is on a riser, we can homebrew the big board keeping costs low, and the smaller cpu board can be farmed out to the guys who can do multi-layer. Square inchage is a major factor in prototype cost. Just a vague idea, but maybe worth considering.

> 2 or 3 PCI slots, 64-bits 66Mhz
> Just so we have them too.. :)

This is a bit over the top. Doubt it could be possible.

> 2 AGP slots
> Graphics cards, ofcourse.

Again, dunno if its possible.

> 1 or perhaps 2 ISA slots, on which a RopoCop gives us Atari Cartridge
> ports, if necessary.

ISA is relatively straight forward, but my feelings are we go with either pci or isa but not both. Having lots of one type of slot isn't as bad as having a few of lots of types. Besides, you are talking like 10 slots, many high end pc mb's don't go that far.

> Atari legacy port... hmm. How about 1 ISA and 1 VME slot?

Dunno. Still looking for my own atari to buy. Have no knowledge of what kind of proprietary ports they use. One isa slot isn't worth the trouble though, I'm afraid.

> This would make up a board with 6/3 PCI slots, 2 AGP slots, 1 ISA and 1

That and kb/mouse ports. At least that seems to be a given.

> Ok, the above might be overkill, but I think it is better to use slots
>rather than incorporate stuff onto the mainboard.

Does have it advantages, I will agree there. Finding or making a case for it though will be a bitch.

Thanks for the input,
John

PS Jared, this is how you should have started things off. Not an accusation, but advice. Think about it.

Hi Djordje,

I've noticed the same thing, also using Newsie .961. I don't know
of a fix. I've tried several things, but no luck yet. The only
work-around to see the entire file is to go into edit mode. I'll
be curious to see if anyone else finds a way around this. Perhaps
Mr. Rojewskie is working on it.

Hi NG
I once owned a (commercial) monitor cable which would connect an Atari STFM to a standard monochrome VGA monitor (Atari monitor DIN in one end and a standard VGA plug in the other with the extraction of sound signal in a female phono plug) .
Does anybody have the lineout for such a cable?

Cheers
Peter Feddersen

I never argued that, but it's also beside the point. But just to be a
stickler, it's not a partitioned part of the OS; it's the OS's kernel,
which is the foundation upon which the OS was built.

>640K barrier.... there are programs which loads 2MB of data, and also some
>of that horrible DLL are 900KB large. Now they will surely not load into 640K,
>no? But somehow, they do.... is it black magic??

There are three types of memory on the PC, as far as any DOS-based
apps are concerned:

1) Conventional memory.
This is the memory that exists from 0-640k. DOS applications
not using a protected mode runtime extender (such as DOS4GW) must be
written to fit within this area of memory. Applications that do use
the extender must have their bootcode or stub fit into this area.

2) High Memory (a.k.a. Upper memory block)
This memory exists between 641k and 1 megabyte. This is an
expanded area of memory contrived in later versions of DOS that
allowed a little more memory to be used, primarily for drivers and the
like in your config.sys files by using the LOADHIGH or LH directives,
or for DOS itself by using the DOS=UMB directive. It was designed to
conserve conventional memory for other DOS apps.

3) Expanded memory (EMS/XMS)
Any memory beyond the 1mb area. This is where protected mode
apps all load the rest of the data -- or where protected mode apps
like Windows load supplimental software and its data.

>Er... that's because Unix was not pre-installed on PC.

And that's because Microsoft saw that it would make far more money
with Windows, a full GUI, than it would with any flavour of Unix
which, at the time, didn't have any such thing as X-Windows. Besides.

Xenix sucked, and came out long after the first version of Windows,
which came out in 1983.

>In all major industrial company, OS2 & Unix was the norm for high volume work.

Unix was primarily for networks, especially universities and any other
major corporation that required very strong, solid networking
capabilities that was also relatively secure.

>That DOS shit will not be able to handle all the network connections, file
>access etc. I still remember that Windows for Workgroup 3.11 was so shitty
>that it hang for a minute or so, when it is sharing the printer.

Novell Netware ran fairly well under DOS, but of course it still
didn't hold a candle to a full-fledged Unix system for stability and
speed.

>Then the day came when IBM shutdown OS2 support, when NT was so much cheaper
>to get. So all the industry big boys have no choice but to try NT.

Which brings us right back to the issue of support. Besides, by the
time OS/2 Warp came out, Windows 95 was released, and people, already
familiar with earlier versions of Windows, opted to go with the new
Windows 95 for compatibility reasons. OS/2 was compatible with
Windows only by loading the Windows Explorer shell to run Windows
software under, so you had to own both operating systems in order to
achieve that compatibility. Sort of redundant, really.

>True, but they need another major change on the computer line ... which never
>came. Instead the change was to stop it & just move forward with the jag.

By the time they invested in the Jag, it was Atari's last chance to
remain a viable company, and when the Jag failed, and Atari merged
with JTS, that was its death knell. Atari didn't have a _chance_ to
release a new system, and at the time of the Falcon's release, it was
quite a powerful machine.

Besides. To say Atari needed a new architecture that divested itself
of legacy compatibility is to say the same thing of Commodore; their
Amiga AGA line (4000 et al) remained backwards compatible to the A500,
and they did pretty well. There's no reason that Atari, at the time,
needed to sink all kinds of money into R&D to develop a totally new
system. It would have been expensive and, at the time, needless when
the Falcon was clearly Atari's most powerful machine and was
competitive, technology-wise, with virtually anything else out there,
with the exception of a fast processor. However, with the likes of
Hades, Milan, et al., there ARE more powerful Falcon-compatibles out
there.

>I am sure if they hardware was powerful, we can easily port some programs like

>I have to wait 2-3 minutes to decode a 5 secs media data - waste of time &
>effort.

Yes, but who's going to do the porting? Where will they get the
licenses from? Or will everyone stick with basic GPL'ed apps?
Overall that'll fairly cripple the machine quite nicely. Unless you
can port all the popular, well-used apps and games, it's not even
worth the effort.

You know, I was looking at the Atari 1040ST schematics and seeing something interesting. At one point, there are four traces with four intersecting traces. Naturally, you can't do those traces on the top side, so you have to go "down under" to attach them.

Imagine, if you will, a double sided circuit board. 12"x12". Copper on both sides. You have four thin traces running horizontally and four traces running vertically you want to connect to the four horizontal ones. How do you do it?

All four traces via to the bottom layer at the same point. Straight across. Now, they're on the bottom. Each continues along it's same path (vertically) and then vias back up to intersect the trace it needs to attach to. If you filled the via with solder you'd have silver dots smack dab in the middle of the horizontal traces. Those horizontal traces continue on to whatever other end point they were headed for, but the four vertical ones are now attached... on a single layer, double sided PCB!

I thought this seemed like an interesting idea that, in examinig several PCBs (motherboards and video cards), I don't see this being done. I see billions of vias dotting the landscape and traces interconnected, but none in the center of traces themselves.

Whether or not this discovery of mine is (or was, at some time) common practice, I dunno. But I was figuring it seemed kinda interesting to me.

including the
> BBC micro and the dreaded all-powerful Wintel. What so unique about
it?

You are right on that account. I guess I was saying the games in general. For example: My brother in law comes over with his 8 year old son, and he is in my studio playing the games most of the time. The arcade stuff. They have a big PC system at home, but they don't have any of these types of games.

> I heard that the Atari MIDI implementation cannot keep the correct
timing. So
> that's the unique thing about it.

I have heard just the opposite which is why many musicians prefer Atari for midi. (that is once they find out about it or started on the platform)There are members on the Atari-midi Egrp that have large PC/Mac systems all set up with the latest stuff, but prefer the Atari for Midi stuff. Check out my site for some of this stuff that is now available.(see sig)

> But hey, there was an TV advertisement which had the some
effects/music done

Sadly,
> that was way back in 1990.

You will find many studios still using Atari for midi applications. they sync them to the PC/Mac for dig audio and the Atari for midi.

Why not? Do you mean drivers, etc? I think we can use it to the same
degree Linux use it. A lot of AGP drivers on Linux out there, waiting to
get ported to such a MiNT system :) I already looked at Alsa for help on
my Sound Blaster (ES1371) drivers. Ofcourse, going for AGP for GFX is more
of a "makeing sure gfx cards are avialable by the time this board makes
it" rather than hoping to utilize its power to the full :)

> considering.

Again, building a bare board like this, we would ofcourse use the
top-of-the line controllers for these sort of things. I understand that it
would complicate things, and that most homebrewers can not make this on
their own. But I think that if we get some specs set up, we could listen
around and see how expensive it gets. Better go overkill at first, then
iron out things as we go :)

>

Taking out ISA is fine by me, I just thought that since RopoCop already
is there, we could utilize it by including one ISA slot. 10 slots ..
overkill, but a real funny thought :)

>
> > Atari legacy port... hmm. How about 1 ISA and 1 VME slot?

One ISA and one VME, or two ISA slots, using the ISA->VME bridge that
exists for the Milan. Our choise.

Ok, if we are to make such a board see the light of day, I think we can
forget about homebrewing it right away. Using a PPC with todays tech,
needs, as pointed out elsewhere in this group, high-precision tools, etc.
So, the only chance we have, in my opinion, is to figure out the specs,
then ask around how much it would cost to have it produced. (not
mass-produced, but lets say, 10 boards). I point out that I really do not
have any idea what I'm talking about here, just "imagining" how it can be
done ;-)

Hello.

A customer sent a 9 gig SCSI Seagate drive in recently, he wanted to use it on his Falcon but it wouldn't format etc.
We used all the software we had to sort it out, no joy so we tried it on the PC.

This attempted to format but returned the legend '.....this drive may have been locked, you must use a utility to unlock it' or words to that effect.

Any ideas, 9 gig on a Falcon would be very useful....

Barrie at Keychange.

>please?. 8~)

Well, let me see..

This will only interest Atari/clone owners within reach of Cheshunt in Hertfordshire. If that's you then the most excellent Cheshunt Computer Club is just the place for you.

We meet monthly, your first visit is FREE, there's tea, coffee and biscuits and the chance to see how others are using their Ataris. You also get the chance to meet Steve, Peter West and erm, myself.

How could anyone resist?

Next meeting is on Wednesday 22nd November, 1900-2200 at the Wolsey Hall, Windmill Lane, Cheshunt.

Map and other details are to be found on the CCC page of my web site (below) :-)

>not that keen on HTML ONLY! M$ Outlook/O express have HTML as it's
>default for newsgroups!

That's as maybe. It's easily changed, so there's absolutely no excuse.

I'd suggest that html attachments in an Atari newsgroup are severely off-topic.

hmmm..... from UK or somewhere that's not going to charge me a ridiculous amount of postage...

ST BOOK (as if!!)
Mega STE (cheap with monitor)
TT (cheap with monitor)
Falcon (preferably with monitor and cheap)
Atari Portfolio (cheap fully working)
Atari N386SX Laptop (anyone?)
Atari PC (either ABC or PC-5 - as if!)
CHEAP Jag CD Unit ( )
CHEAP Jag Games (power drive rally? primal rage? Val d'Isere - Skiing and Snowboarding? Atari karts?)
California Games / Stun runner for LYNX.

if you have any of these please let me know how much you' want for them and I'll consider it. thanks. otherwise I'll end up having to order from US or Germany.,

thanks

Hi all,

Could be my CAB 2.8 setup, but the above URL shows as code. A large block of Java script, followed by the HTML. I loaded the lot into qed, cut of the Java Script and resaved. Viewed locally CAB shows the page OK.

Bob King.

> Did you read the bit that said 2 'YEARS', did you mistake that for 'days'

>Is the difference here not one of Cortex taking your money and not supplying
>where as I did not cash any cheques etc?

What i see here is you trying to squirm out of the fact that you screwed a lot of peop's by offering a service and then not providing the goods, and then tried to excuse it by saying " but i didnt cash the cheques guv" so everything is alright now.

You may have been well intentioned, but the bottom line is that you pissed people about, you didnt provide a service other than one of keeping cheques warm and dusty.

Face it, you fucked up, big time, as is evident here, often, now stop trying to cover it up, face people, admit you pissed them off.

If you can't find one of the (very rare) 5 1/4 inch floppy drives that
were manufactured for the Atari PC (but also usable on the ST), you
may want to look into finding the documentation on making an adapter
cable to use an original 8-bit Atari floppy drive on the ST.

Long ago in the forgotten mists of the "good old days", I was talking
with Darek Mihocka, who developed the GEMulator emulators. He had
worked out the 8-bit Atari emulator for the ST to the point where it
was practical, but the physical problem of actually transferring 8-bit
software into the ST was still holding him back. Essentially you were
limited to using either a direct wire or two modems to send programs
across to the ST with terminal software.

I suggested that since the 8-bit SIO port was really nothing more than
a fast serial port that he look into hooking the 8-bit floppy drive up
to the ST's serial port.

He said "Hey.. whoa..! bzzzzzttt zzB ... NO CARRIER"

A couple of weeks later he unveiled the 8-bit - ST Floppy drive link
cable. Instead of using the serial port, he set it up to use the
ST's parallel port, and it worked just great.

Essentially you take an 8-bit SIO cable and either just cut off one
end, or do what I did and peel back the insulation half-way between
the ends, then solder on a male DB-25 connector that will fit into the
ST's printer port. Run his driver software on the ST, and the 810
or 1050 floppy drive becomes an ST floppy drive with its own icon on
the desktop.

Pop in an 8-bit floppy and read or write to it just like it was any
other ST drive.

It made transferring 8-bit programs to the ST for use with the 8-bit emulator a breeze.

I'm sure glad he thought of it..! :)

Only problem- I have absolutely no idea what I did with either the documentation showing how to make the cable, or the software to make it work. If you're interested in trying it, check on Darek's GEMulator web site. It may be posted there, or you might be able to get hold of him by e-mail and ask him if he can dig it out for you.

Tell him BobR sent you..!

BobR

Rodolphe will most probably not be producing this board at all. The
reason? I take it the same reason none of us would do that, even with the
skills - MONEY. How are we gonna solve that? Anyone? Could we unite and
"hire" Rodolphe to produce this board?

Regards,

Odd Skancke - ozk@atari.org - http://assemsoft.atari.org

Hya

The lead isn't special if it's from the modulator to the TV. It's a standard RCA phono on one end and a TV connector on the other. YOU can use leads from other machines: amigas, c64, sega master systems/megadrives, snes..

Any decent, or half decent, console shop should stock them for a quid or 2. Or gets the bits and make one yourself!

>Thnx

It doesn't look much in IE5, but it was meant as a joke:)) I can't see a problem publishing the article, it's not an attachment and it's not a binary.

Some people publish article in text AND HTML are they to stop that as well!!! I think not. It was published like other jokes or articles are published in the original context.

Were you disappointed that it wasn't the ACTUAL source?

As far as I'm concerned HTML is acceptable in a newsgroup, although I'm not that keen on HTML ONLY! M$ Outlook/O express have HTML as it's default for newsgroups!

Honestly, some people...

>amiga. At best, it's another webTV, cause that's what they want it to be.
As
>far as a crossplatform os, do we really need another?

You missed the whole point of AmigaDE I feel. The AmigaDE operating environment is different as it allows any programs that are written to work on it to run on any architecture (PPC/Intel/whatever) - without having to port a thing. Just the one executable coded is guaranteed to run on any system/OS, which is going to save developers a lot of development time (and money). The benefits for the consumer are that software prices will drop, they won't need to lose their existing software and using a common OS to all platforms makes file sharing/compatability so much easier.

I don't see this as a bad thing.
As for this not being an Amiga... I'd rather look forward then stick with old outdated unsupported technology like Amiga/Atari of today. I'm not alone here, just check the market share of those platforms...

In any case, I'd rather look forward to face an uncertain future then be stuck in the distant past where there is no future.

Just my 2c

Regards,

Clockmeister.

This sort of thing has been done for eons now. Have you seen three (or more)
layered motherboards?. Traces are sandwiched between layers of PCB, not even
visible.
All modern day PC boards are like this.

Those who fail to learn Java are doomed to repeat it. This eats up cpu
cycles, for a rather questionable advantage. Software prices won't drop.
It's a proven fact that almost all softcos charge what they feel like. And
to add insult to injury, they have to whore the amiga name out on this
farce.

>I don't see this as a bad thing.
>As for this not being an Amiga... I'd rather look forward then stick with

Old? Like the PC? It's unsupported because they choose not to support it.
And you're posting to the wrong newsgroup then. People here tend to like the
Atari (though not so much amiga) and more than anything want there to be a
new one.

>In any case, I'd rather look forward to face an uncertain future then be
>stuck in the distant past where there is no future.

That sounds dumb. Really.

John

Well, the project is starting to shape well, many parts are finished,
database pretty much setup. I would "require" 2 things if it is not too
much asking:

1) Someone to make a few graphics for it (has to remain simple and fast to
load, with a white background contrast (ebay, mp3.com feeling).
2) I would love to receive an Atari Tshirt for the job. (red, or orange, I
saw some for sale on online store for like 8 bucks).

Who's up for what? Is that too demanding?

Not at all.

I did not screw people. CyberSTrider (the shareware scheme) was always a part time thing for me... I actually made a loss each and every year from running this, always having to subsidise it with any spare cash I had. I was also running it in any spare time I had - which became less and less as my own career with employers got better and higher profiled. Add to this, my own family life. So leaving the house at 7am in the morning to return at 9-10pm did not leave much time for looking after shareware. This is not an excuse, but I felt that my family took a higher preference to anything else.. especially running the shareware scheme. Add to this, my own sanity.

The scheme had been running since 1993. In 1998 I posted a message in various places of my intention to close down the scheme and that things would be slowing down gradually. This message also went up on the web site at the time. In April 1999, I posted a message about the closure of CyberSTrider, the shareware scheme and that things would be wound down by April 2000.

In the meantime, I had started up Cyberstrider Ltd, quite my full time job and worked on winding things down with the shareware scheme.

> You may have been well intentioned, but the bottom line is that you pissed
> people about, you didnt provide a service other than one of keeping cheques
> warm and dusty.
> Face it, you fucked up, big time, as is evident here, often, now stop trying to
> cover it up, face people, admit you pissed them off.

I do admit, people got pissed off with me toward the end of the shareware scheme. If truth be old, the scheme should have closed down back in 1996 or thereabouts... the market was too small even then, and in the two years to actual closure of the scheme I had only received 15 orders (yes I can count them).

If fucked up big time entails pissing off 15 customers, then
fair enough - all those telecoms firms, utility firms, transport firms
must be fucking up to high heaven and back (crossing over the three
worlds). Let's just forget about the thouands of others who were happy
with the service received by the CyberSTrider shareware scheme.

I did try my best at gettig the final orders out, but being out of
the country a lot makes things that bit harder. I had even made the offer
publically about someone taking the Atari shareware scheme off me and keeping
it running. I only got one offer, but then they did not follow it up.

I still stand by my stance that this is not the same as Titan/Coretex.

Regards
Denesh

Newer Hard Drives auto-park the heads. You won't get a program to unpark the
heads because this happens automatically once the drive is powered up again.

Parked heads do not cause a problem, and the problem I believe to be some
foreign format that the Atari driver will not attempt to re-format.

Barry, have you tried HD Driver 7.8?

The author tells me that a very few drives can read the extended Atari
formats, most can just about do 82/10

For anyone having problems, try running in DOS. Windows can cause problems,
although I havent used Windows Me. Maybe they fixed it?

Simon

5227. AMS 2000 Show, 11th November, Stafford

Newsgroup: comp.sys.atari.st
Date: 2000-11-05 00:00:00 UTC
From: Simon Osborne <atariactive@crap.btinternet.com>
Message-ID: <8u3qik$4mq$1@plutonium.btinternet.com>

Hello,

Just a reminder to everyone that the AMS 2000 show is being held on Saturday 11th November, at Bingley Hall, Stafford. 10am till 4pm.

The site is situated on the A518, about 10-15minutes from Junction 14 of the M6. There is a shuttle bus to and from Stafford Rail Station during show hours.

Some of the Atari exhibitors are:

Abingdon Synthesis Products - The home for some great add-ons for your Atari
Alive! Diskmagazine Team - See whats happening in the world of Disk Magazines
Atari Active - The UK's first online Atari Magazine
Keychange Music - Fine-tune your Atari with some great add-ons, and much more
Portfolio Club UK - For all things Portfolio related
Tyne & Wear Atari Group - User-group action with the team from the North
Telegames - Atari Jaguar and Lynx gaming action

And the usual selection of PC hardware etc.

For more information, visit the Sharward website at www.sharward.co.uk or telephone 01473 212113, fax 01473 212114.

For people interested in booking a stand, Hurry! Not many places left, and get them whilst you still can!

See you there!

Simon Osborne

>The author tells me that a very few drives can read the extended Atari
>formats, most can just about do 82/10

Well, that's about 99% of the disks out there; not many use 11 because
of reliability and speed issues, and almost no one used 83 sector
formats because that even caused problems on real STs with drives that
couldn't handle it.

>For anyone having problems, try running in DOS. Windows can cause problems,
>although I havent used Windows Me. Maybe they fixed it?

Ha! You honestly believe Microsoft would release a new version of
Windows that fixed *anything*? :-) No, WinMe's big change (aside
from a load of new garbage like Movie Maker and Windows Bloated-Hog
Media Player 6)) is the removal of real-mode DOS. There IS no DOS
mode anymore. Only a DOS shell from the desktop. You can't boot to
it, you can't shut down to it -- quite simply, it isn't there anymore.
They say this is because real-mode DOS was what was causing most of
the instability problems under Win9x, and that its removal
dramatically increased the system's overall stability.

I say rubbish, pish-tosh and bullocks.

Still, 99% of DOS apps work fine -- any DOS apps that can run in
available conventional memory, or any DPMI-based (protected mode) app
works just fine. Nothing that absolutely requires real-mode will
work, however.

>So much for their online support, I guess.

I think he only expected to see peop's whistling sunshine up its arse, he wasnt ready for peop's who complained at the crap unfinished interface, the 'page of text' buttons and the glaringly obvious shortcut errors, not to mention the font selector sort bug and the colour popups that only work on fridays whilst facing east and whilst using a graphics card that no atari could possibly use.

Were not alone, apparently the PC version is shagged sensless as well.

And were meant to be gratefull for this.

Ive bought every version of Papyrus there ever was, and i'm waiting for this version 8 to come out of beta test phase and to be finished so i may buy it.

All normal drives do this un-parking during startup, so I doubt it would help. All modern drives have an "auto park" function, so there's no meaning in running a parking program anymore either. They actually use the mechanical energy after power is switched off, to move the head to a safe location and mechanically lock it there - so even at a power loss, the drive is parked automatically.
One thing to check could be to see if you can find a jumper which switches between two modes of startup. One "spin up at power on" and the other is "spin up on command". Those modes are set with one jumper and you can probably find which one on the manufacturers' website. Set it to "spin up at power on" and you'll make sure the drive will always start...

I'm located in the USA and it appears you are in the UK.

I was thinking $250 US for the CPU, keyboard, DOS floppies,
GEM floppies, instructions (photo copies I think, I'd have to check for
sure), monitor which is in the box.

Plus shipping.

Sent via Deja.com http://www.deja.com/
Before you buy.

I personally enjoy using Calamus 99 (about to upgrad to 2000).
Since it's early days it does a whole lot more. like TTF, Bridge
(dataformer which actually works), PS interpretation (calipso and calipso
lt).
and it's got all kinds of great stuff. The 2000 version is even better so
I've heard. I just purchased Pagesteam for the PC (beta version believe it
or not!!!)
but to me it's not quite the program Calamus is. I recommend Calamus
highly.

>anyway could hardly be construed as a problem.

Do you have a problem reading messages? It's 2 YEARS!!!

And it's not the software, but the code that unlocks that software that
Danny was "selling". Good Grief!

>I believe that some heads must be 'parked' if the HD is to be shipped!

I believe that modern (and the Seagate in question is certainly that)
drives park themselves automatically, using energy derived from the still-
spinning platter when you remove power.

Hi Bob,

BR>If you can't find one of the (very rare) 5 1/4 inch floppy drives that
BR>were manufactured for the Atari PC (but also usable on the ST), you
BR>may want to look into finding the documentation on making an adapter
BR>cable to use an original 8-bit Atari floppy drive on the ST.
I don't think it's as difficult as you described it. A drive correctly
jumpered and a correct cable should be all you need.

I had a TEAC 5.25 drive hooked to my 1040 ST and can't use it any
more, for the TT doesn't support it although the TT's internal drive
and the (external) 5.25 drive are high density devices.

Hi Simon,

SO>Newer Hard Drives auto-park the heads. You won't get a program to
SO>unpark the heads because this happens automatically once the drive is
SO>powered up again.
that's it!

SO>Parked heads do not cause a problem, and the problem I believe to be
SO>some foreign format that the Atari driver will not attempt to re-
SO>format.
No SCSI drive needs to be formatted in order to use it with an Atari
computer, and I think that should be true for any OS type.

A simple partitioning and a reboot afterwards is all you'll have to do.

A couple of weeks ago, I was offered a SCSI drive that obviously had
been used on a UNIX system, so HDDRUTIL (7.8) complained of a strange
partition type (neither GEM nor BGM, but something like $1B), I
partitioned twice, rebooted and: I felt fine!

In the case of a locked drive I'd try to 'play with jumpers',
especially the 'automatic motor spindle on`. And if it's a Seagate,
I'd even try to use the factory jumper, just to power up the drive...

Und TTschï¿½

(Snipped and Saved)

Thanks for this info...

I do have one of these Cables and tried it on a 1040STE TOS 1.62 4megs, using a Happy 1050 drive.

I could never get it to work. The drive would try to access the disk 1 time, then it would time out or something and I would have to turn everything off and re-boot. Not sure if the problem was with the drive being Happy enhanced, or a early version of the software. I've not tried it since, been a few years.

A friend of mine in Florida knew someone who made the Cables and got him to make one for me. It looks very pro. So I think that the cable is ok.

I'll have to get the latest version of the software and try it again.

However I did find someone who sold me a 5.25 drive made to use on the ST. Hasn't arrived yet. I think it is called a I B drive. I don't think that it can be used to transfer Atari 8-bit files to the ST. It would be cool if it would. Mostly I want the drive so that I can try transfering some old PC software on 5.25 over to my Mega STE that has the AT Once 386SX board in it.

I do have an ICD MIO 1 meg version that I could probably use to transfer 8-bit files to the ST-Falcon using the RS232 port. The MIO will do 19200. A Null Modem cable should work.

Thanks for the help,
phantomm@eastky.net

Doesn't it help to use the low-level format function in the SCSI-card on the
PC?

Try running a low-level format on the drive. A program called Ontrack would
help.

Simon

It must be obvious to all that Dennis has not made his fortune out of the Atari community, one look at his site will tell you he is a fully fledged COE running a huge corporation, his interest in Atari computers can only be a sideline and without great guys like this the world would be a very sad place, so waiting two days for a bit of software that was on a cover disk anyway could hardly be construed as a problem.

Barrie,
I believe that some heads must be 'parked' if the HD is to be shipped!
I have a program from ICD to do this called HDPARK.TOS but not a program
to un-park the heads. However, it may work either way (if heads are parked
it un-parks them and visa-versa but that's a guess on my part). If you'd
like to try it, E-mail me and I'll send it out to you.
